Executive Summary

Benchmarking Effort Overview

In 2009, Mayor Michael R. Bloomberg signed the Greener, Greater Buildings Plan, a landmark legislation package that enacted a set of energy efficiency requirements for existing buildings in New York City. Local Law 84 requires facility owners of public buildings over 10,000 square feet and private buildings over 50,000 square feet to benchmark their energy use each year. Since 2009 the City has benchmarked 2,730 buildings including libraries, police stations, firehouses, schools, courthouses, health, community, and family centers, and government offices. The City performed this benchmarking using the U.S. Environmental Protection Agency's (EPA) Energy Star Portfolio Manager tool which is widely accepted as the industry standard for benchmarking. For eligible facilities Portfolio Manager rates energy performance on a scale of 1–100 enabling building managers to see how their facilities are performing relative to similar buildings nationwide. This report highlights the Portfolio Manager benchmarking results for libraries, fire stations, police stations, warehouses, medical offices, K-12 schools, courthouses and office buildings. These building types represent a variety of City departments' facilities and provide a representative sample of municipal buildings. Collectively, these eight types make up more than 75% of the City's building portfolio.

Role of Benchmarking in Carbon Reduction Strategy

This report provides the most comprehensive benchmark information possible on New York City government buildings which are 10,000 square feet or larger. Although NYC government buildings of this size are, on average, performing near the national average, there is still much work to be done to achieve the City's greenhouse gas reduction goal of 30% by 2017 below fiscal year 2006 levels. While benchmarking is an important tool, it is just one part of the City's overall approach to achieving this goal. NYC government's carbon reduction implementation strategy is based on an integrated, data-driven approach. The City uses benchmark scores and other data to prioritize energy audits, retrofits, improved operations and maintenance, and retro-commissioning activities.

Benchmark Scores

New York City K-12 schools, courthouses, medical offices, warehouses, and offices performed near national averages. The 1,162 public schools had an average benchmark score of 53, slightly better than the national average for K-12 schools. Both medical offices and warehouses showed somewhat poorer performance than the national average each with an average benchmark score of 43. Courthouses and City offices had average benchmark scores of 54 of 59 respectively, which indicates that they performed slightly better than similar buildings nationwide.

Non-Ratable Building Energy Use Intensity Results

Non-ratable buildings are included in facility categories that are not currently eligible for receiving benchmark scores using Portfolio Manager. The City's 108 libraries' average energy use intensity (EUI)

was 22% better than the national average. Its fire and police stations showed poor average results at 18% and 8% worse than the national average respectively. For facilities with significant variance from the national average such as police and fire stations, the City has undertaken several data quality improvement efforts. These efforts will determine if the poor benchmark results might indicate a data quality problem; whether the national averages include facilities like firehouses with volunteer fire departments which might bias the results; or if there are actions that the City can take to remedy these buildings' poor energy performance.

Introduction

New York City Benchmarking Efforts

In 2009, Mayor Michael R. Bloomberg signed the Greener, Greater Buildings Plan, a landmark legislation package that enacted a set of energy efficiency requirements for existing buildings in New York City. One component of the Plan is Local Law 84, which requires facility owners of public buildings over 10,000 square feet and private buildings over 50,000 square feet to benchmark their energy use each year. Since 2009 the City has benchmarked 2,730 buildings including libraries, police stations, firehouses, schools, courthouses, health, community, family centers, and government offices.

The Division of Energy Management at the New York City Department of Citywide Administrative Services (DCAS Energy Management) manages the energy accounts and conservation initiatives for City government operations including benchmarking reporting. DCAS Energy Management is responsible for achieving the PlaNYC goal to reduce City greenhouse gas (GHG) emissions 30% by 2017. PlaNYC is the City's blueprint for climate action. DCAS is implementing an integrated, data-driven GHG reduction strategy for buildings that includes energy audits, retrofits, improved operations and maintenance, retro-commissioning and ongoing data analysis. Benchmarking building energy performance supports this effort by helping the City target the best opportunities for GHG reductions in City-owned and -operated buildings, track energy efficiency progress over time, and provide important feedback to agencies' planning teams, budget groups, and facility staff.

DCAS performed its energy benchmarking using the U.S. Environmental Protection Agency's (EPA) Energy Star Portfolio Manager tool, which is widely accepted as the industry standard for benchmarking buildings. For eligible facilities Portfolio Manager rates energy performance on a scale of 1–100 enabling building managers to see how their facilities are performing relative to similar buildings nationwide. To calculate ratings Portfolio Manager uses information on electricity, natural gas, steam, and fuel oil consumption and adjusts for other factors, including building type, gross square footage, year of construction, weather, and operational data like operating hours and number of staff. Buildings that are not eligible for benchmarking scores still receive useful tracking information such as Energy Utilization Index (EUI), or energy use intensity, and GHG emissions figures.

Information Sources and Data Quality Improvements

Benchmarking City buildings with Portfolio Manager required several data sources. First, energy use data was collected from the Energy Cost Control and Conservation (EC3) system, a customized online system that stores energy billing information and creates agency energy cost and usage reports. For building attribute information, DCAS worked with City agencies to verify and update existing datasets. Building management teams at 28 agencies signed off on all building data used for benchmarking. DCAS is currently working to make sure that the benchmarking data is as accurate as possible by addressing the following issues:

- **Campuses.** Some groups of buildings were benchmarked as one structure due to a lack of sub-metering. The City is working to sub-meter these facilities and plans to benchmark each building individually in the future.
- **Mixed-Use Buildings.** A building's use category is an important variable when determining Portfolio Manager benchmarking scores. The City operates some buildings that fall into more than one ratable space category. For example, several facilities contain both office and courthouse spaces. Portfolio Manager allows users to enter separate space types into the system for each individual building; however, for this report, mixed-use buildings were entered into Portfolio Manager as only one of the space types. In some cases, this approach could skew benchmark results. DCAS is now working to include separate spaces in Portfolio Manager for mixed-use buildings.
- **Heating Fuel Oil Data.** Heating fuel oil is the City's only energy source that is not purchased and tracked centrally at DCAS. When the City launched the benchmarking initiative, fuel oil contracts did not require that vendors provide usable delivery data. As such, DCAS was only able to acquire fuel oil data from three vendors. Moving forward, DCAS's contracting office is now requiring City vendors to provide delivery data. DCAS will process and upload the remaining fuel oil information as it becomes available.
- **Energy Meter Associations.** DCAS is currently working with agency energy teams to improve the associations between utility meters and buildings to ensure that all linkages are accurate.

Utility Data Analysis

Before benchmarking scores provided more nuanced performance rankings, DCAS used energy usage and cost information to monitor and evaluate the energy efficiency of City buildings. For example, in the past the City used electricity bill data to select buildings for lighting efficiency projects. Energy reports from utility bills help the City track costs, monitor usage over time, and provide a key indicator for the City's GHG emissions tracking.

In recent years, DCAS has worked to enhance utility reports and transition from an older mainframe system to a more integrated and flexible web-based database and reporting system. EC3, launched in 2010, allows users to monitor utility-billed energy costs and usage on the account, agency, and Citywide levels. EC3 provides graphic, user-friendly energy consumption indicator reports and supports data needs for benchmarking and other PlaNYC initiatives. EC3 enables the City to track its energy costs and usage more efficiently and effectively.

In fiscal year 2010, City government energy usage totaled 52.7million mmBTU. Figure 1 below shows the breakdown of usage by utility type. Figure 2 shows the distribution of energy consumption by end user, with the Department of Education accounting for about a third of all City government energy usage.

Figure 1: Percent of City Government Energy Use by Utility Type, FY 2010

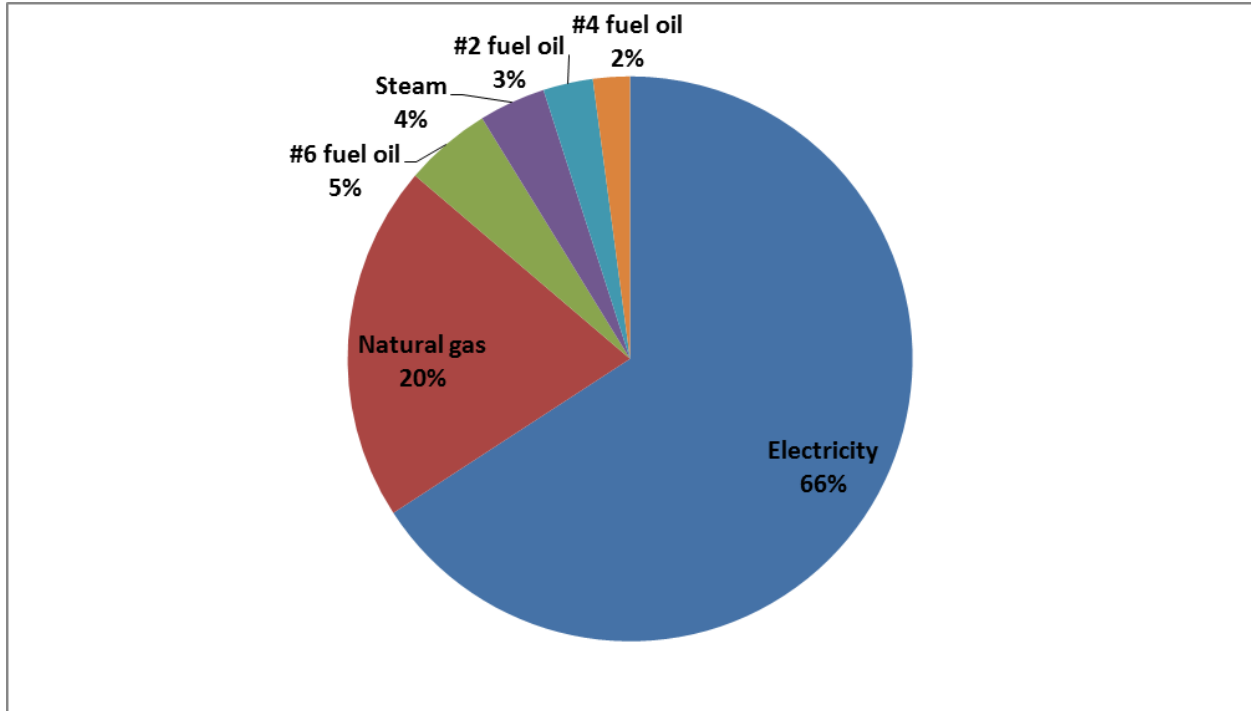

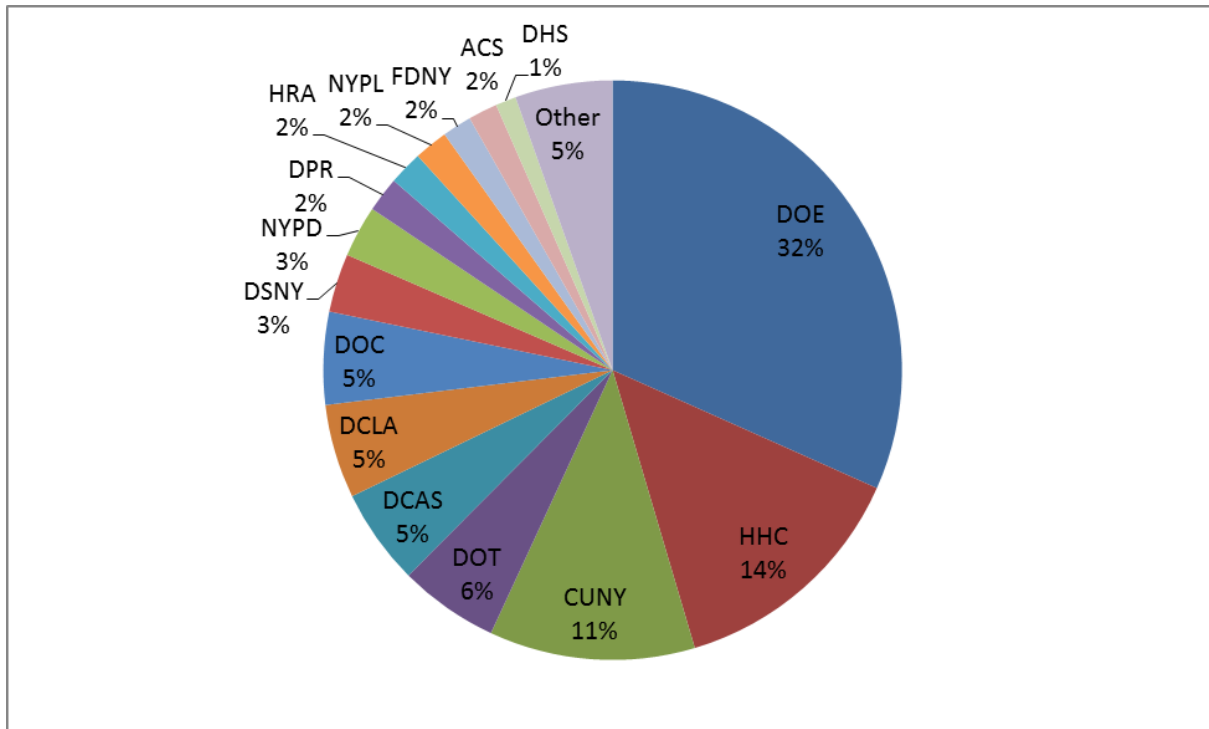

Figure 2: Percent of City Government Energy Use by Agency or Service, FY 2010¹

Role of Benchmarking in Carbon Reduction Strategy

Benchmarking is a critical step along a path toward deeper understanding of the City’s building energy use. While it is an important tool, benchmarking is only one part of the City’s overall data-driven and integrated approach to achieving its 30 x 17 GHG reduction target. Together, the initiatives described below will help the City achieve its carbon reduction goals.

SEPTS

Benchmarking is part of a larger effort to improve the City’s performance tracking and analysis abilities. The benchmarking process will be integrated into the Sustainability Energy and Property Tracking System (SEPTS), a new database that centrally collects, tracks, and reports on information concerning the energy and environmental performance of City government buildings, capital projects, and other building characteristics. SEPTS integrates and builds on multiple existing databases to facilitate tracking and compliance for the City’s sustainability- and building-related laws. The system also automates

¹ Note that Department of Environmental Protection energy use is not accounted for in this figure as its use was considered industrial rather than building energy use for the purposes of this report.

building benchmarking and reporting, coordinates agencies' project selection and implementation, and makes it easier for agencies to collect, update, and verify building and project data. Phase I of SEPTS was launched in April 2011.

SEPTS makes building information more accessible to users across City agencies. By 2012, the system will also enable a more efficient benchmarking process by communicating directly with agency facility managers and the EPA Energy Star Rating System through its Automated Benchmarking Service (ABS).

Audits and Retrofits

By providing a snapshot of energy consumption, benchmarking plays a key role in the selection of audit and retrofit projects in City buildings. Following Local Law 87 of 2009, the City's audit and retrofit program identifies and implements energy conservation measures (ECMs) and retro-commissioning measures (RCMs) in existing buildings to improve energy efficiency and reduce GHG emissions. Forty-five percent of the City's target GHG reduction is expected to come from retrofitting existing buildings and replacing equipment with more efficient models. As of November 2011, DCAS has completed 130 retrofit projects with another 28 in construction and 74 in design; 68 energy audits are currently underway. An additional 650 energy audits managed by the School Construction Authority are expected to be completed over the next ten years.

Since 2009, DCAS has worked with each agency to review initial benchmarking results and identify priority audits and retrofits for the coming years. Audits follow ASHRAE Level II guidelines and include an assessment of electrical, HVAC, and building envelope systems to identify feasible energy retrofits and clean energy installations. The audit report assesses annual energy savings, implementation cost, and simple payback for each retrofit measure. The City uses these recommendations to determine which retrofit projects will be implemented. To read about current and completed retrofit projects, please visit <http://www.nyc.gov/html/dem/html/studies/studies.shtml>.

Small Buildings Retrofit Program

Benchmarking will also play a role in DCAS's small buildings program, which is currently being developed to identify energy conservation opportunities in City buildings between 5,000 and 50,000 square feet. In November 2011, DCAS issued an RFP for program planning and development, program administration, and energy efficiency project implementation services in these buildings. Using the benchmarking data as a guide, the winning contractor will develop a roadmap that prioritizes groups to address the worst performing buildings first, maximizes economies of scale and geographical proximity, and establishes a schedule for addressing each group of buildings. The contractor will then implement the plan starting with a group of pre-determined pilot buildings.

Operations and Maintenance

Benchmarking will also inform the City's Operations and Maintenance (O&M) program. O&M practices are the day-to-day activities of a building's engineer or operator to keep a building operating effectively. Energy efficient O&M practices include monitoring energy use, adjusting and properly maintaining equipment, and operating the building's HVAC system and other mechanical systems.

In October 2009, DCAS and its consultants completed a year-long study that identified opportunities for improving the City's O&M performance. These recommendations were tested during a one-year pilot at ten schools and six office buildings. Based on findings from the study and pilot, DCAS developed the Energy Efficiency Operations and Maintenance Plan (EEOMP), which focuses on repairing, maintaining, and operating existing equipment efficiently; increasing training and outreach to improve skills and raise awareness; and providing management oversight, accountability, and transparency. Implementation of the EEOMP is expected to reduce citywide energy usage 10-15% per year resulting in savings of at least \$51 million and 185,000 metric tons of GHG.

The second phase of the EEOMP is underway with the seven City agencies that consume the most energy and together represent 75% of the City's building portfolio over 50,000 square feet: DCAS, Department of Education (DOE), Department of Correction (DOC), Department of Sanitation (DSNY), Police Department (NYPD), Fire Department (FDNY), and Department of Parks and Recreation (DPR).

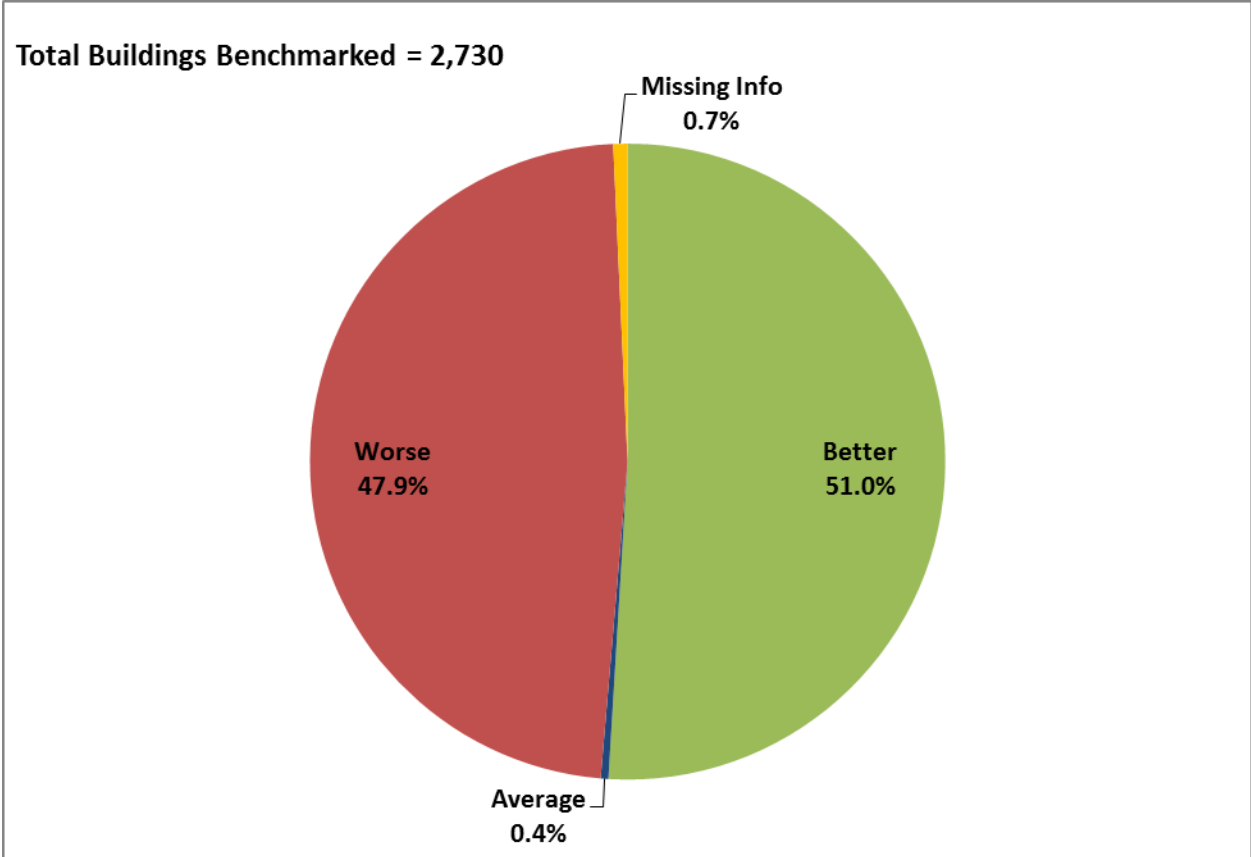

Sub-metering

To improve the benchmarking data and achieve more precise measurements of building energy use, DCAS is working to sub-meter City campuses that lack individual meters for each building. This is part of a larger initiative to deploy an Energy Enterprise Metering System (EEMS) to better monitor energy use, inform operational decisions, and support peak load management and smart networks across City buildings. The City will build on existing meters and Building Management System (BMS) units by installing electric, steam, fuel oil, and natural gas smart meters and integrating them with Citywide monitoring software. In addition, EEMS will allow the City to automatically control energy consuming equipment and peak demand load through BMS units. EEMS is expected to be operational by the end of 2013. The new system will also help set the foundation for the future smart grid, connecting emerging technologies like solar photovoltaic, cogeneration, and electric vehicles.

NYC Government Buildings vs. National Average

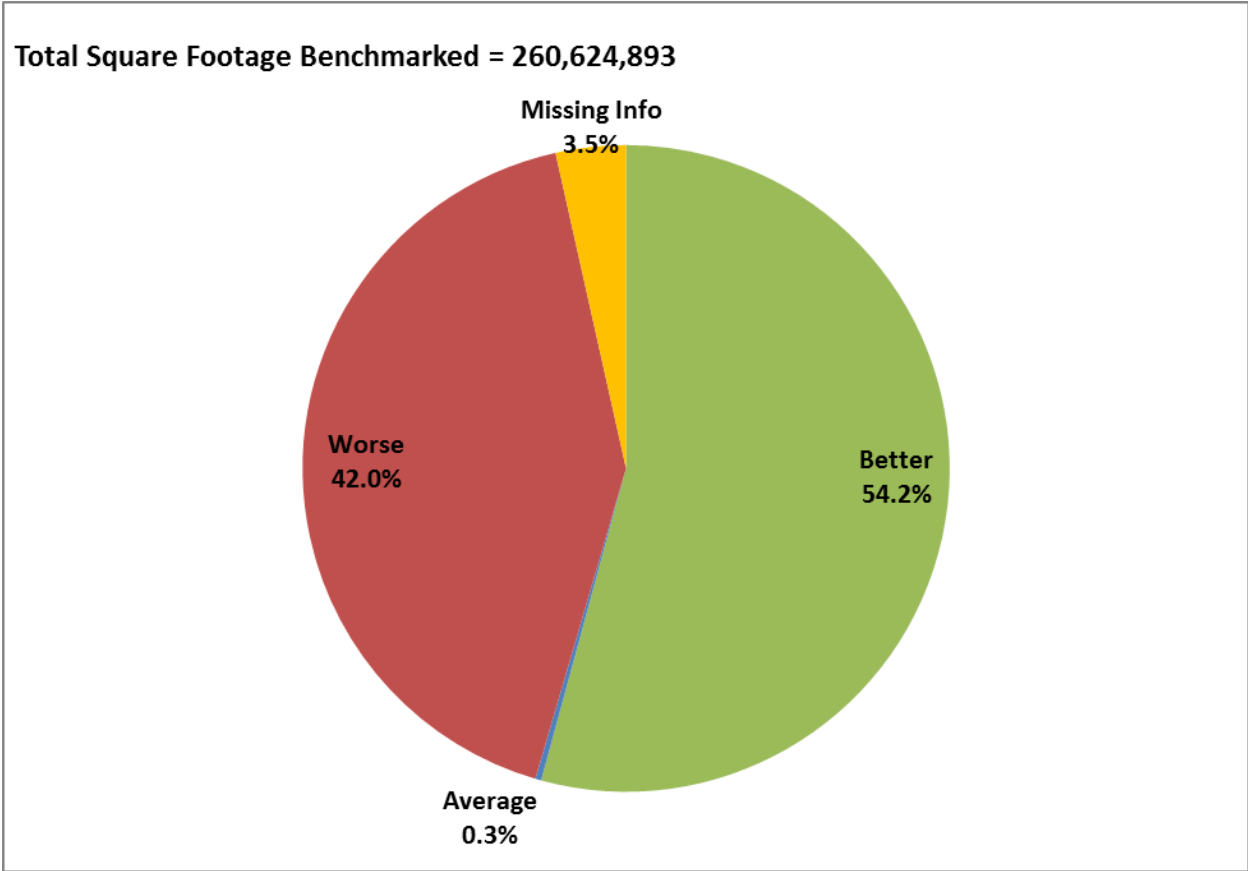

Benchmarking results for January to December 2010 show that the City's 2,730 buildings² over 10,000 square feet performed, on average, on par with or better than national averages. See Figures 3 and 4.

Figure 3: City Building Energy Performance Compared to National Average (by building), 2010

² 707 of the 2,730 City buildings are on 47 campuses and did not receive individual benchmark scores in Portfolio Manager.

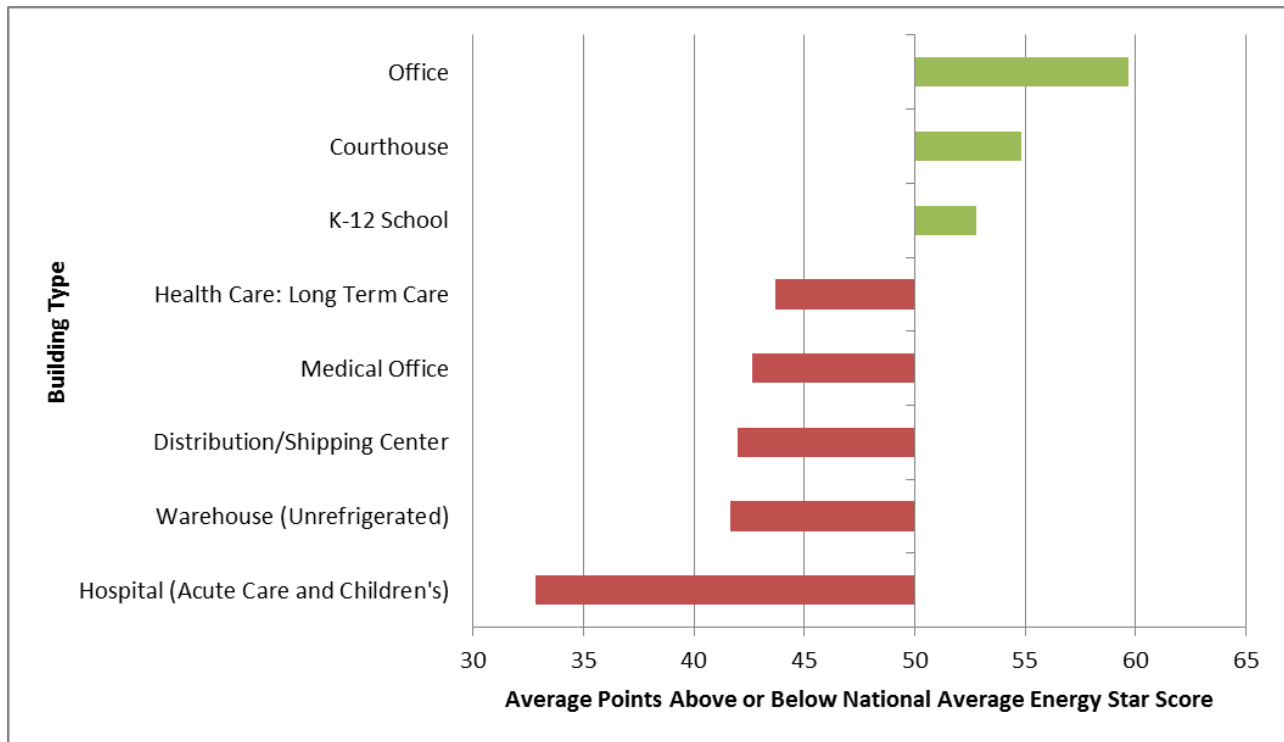

Figure 4: City Building Energy Performance Compared to National Average (by square footage), 2010

Ratable Building Benchmark Scores

Figure 5 on the next page shows the average benchmark score for each building type ratable by Portfolio Manager, compared to the national average of 50.

Figure 5: City Government Building Benchmark Scores: Points from National Average, 2010

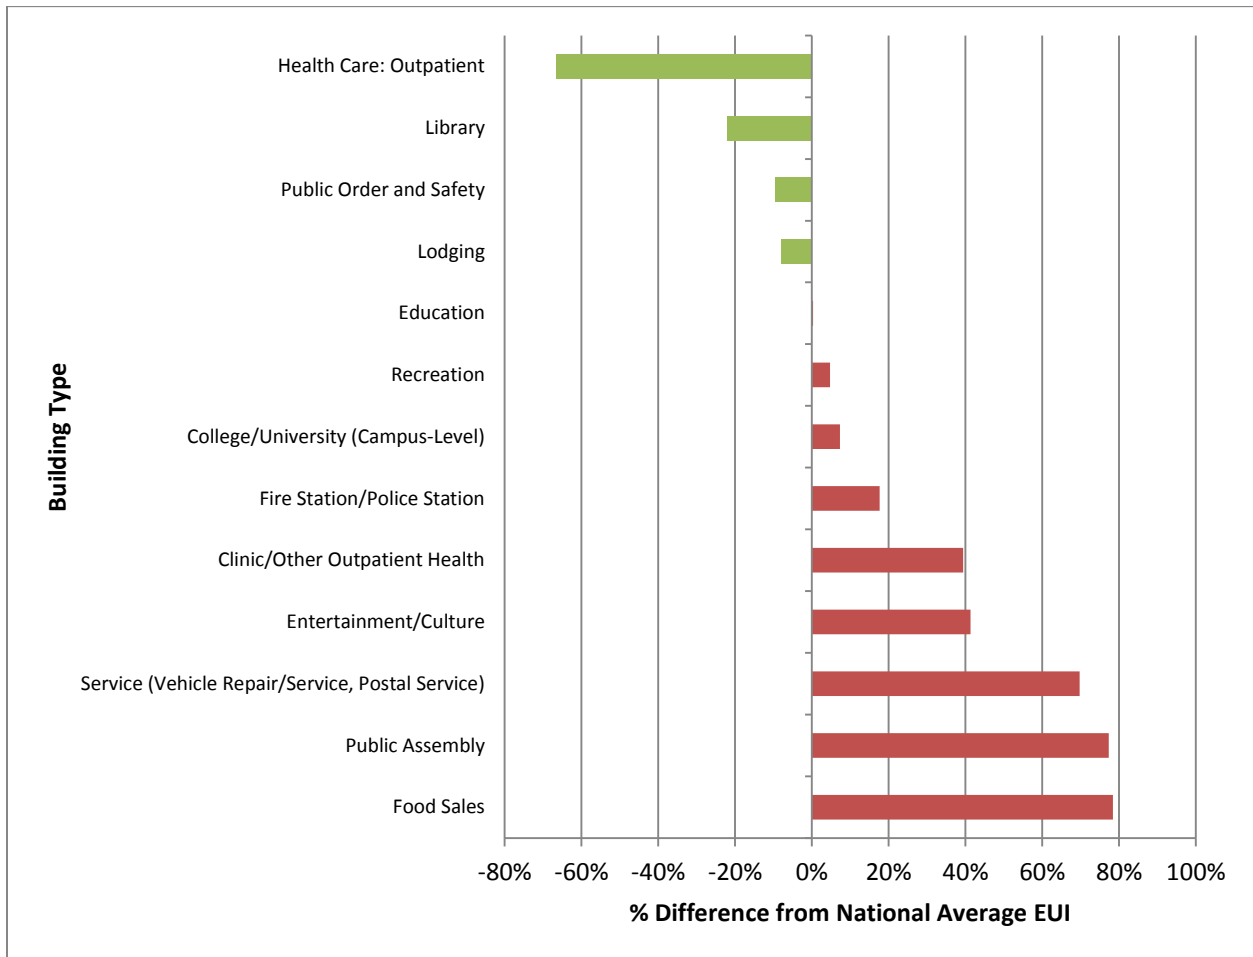

New York City K-12 schools, courthouses, medical offices, warehouses, and offices performed near national averages. The 1,162 public schools had an average benchmark score of 53, slightly better than the national average for K-12 schools. Both medical offices and warehouses showed somewhat poorer performance than the national average each with an average benchmark score of 43. Courthouses and City offices had average benchmark scores of 54 and 59 respectively, which indicate that they performed better than similar buildings nationwide. The hospital, distribution/shipping center, and long-term health care facility averages are shown in Figure 5, however, additional data verification is required to ensure the accuracy of these scores. Future benchmark results will reflect any data quality improvements for these building types.

Non-Ratable Building EUI Results

There are 673 City buildings and 47 campuses included in facility categories that are not currently eligible for receiving benchmarking scores using Portfolio Manager. For these buildings, the City uses the Energy Utilization Index (EUI) to compare similar facilities.

Figure 6 shows the average EUI for each building type that is non-ratable by Portfolio Manager, compared to the national average EUI for each building type.

Figure 6: City Building EUI Averages: Percent from National Average by Building Type, 2010

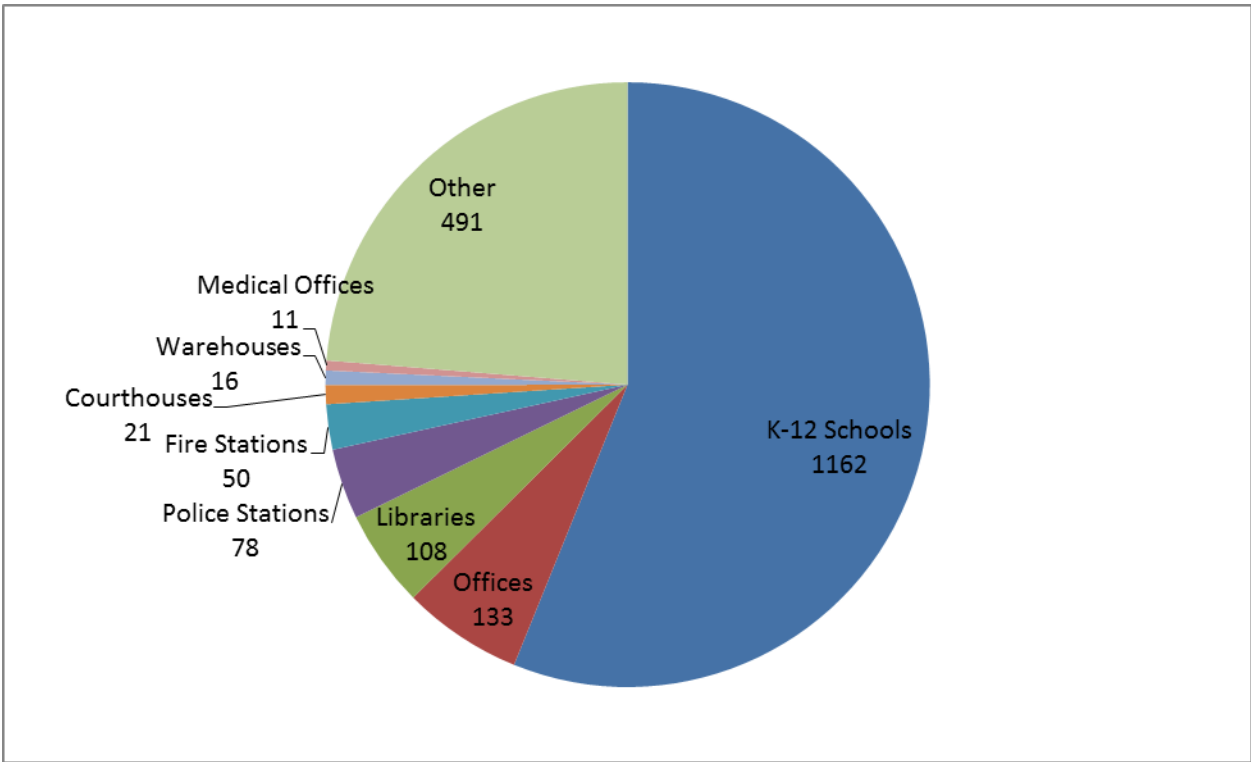

New York City outpatient health care facilities, libraries, public order and safety buildings, lodging, educational, and recreation facilities as well as college campuses performed near national averages. Public order and safety and lodging facilities performed 10% and 8% better than the national average, respectively. Recreational facilities and college campuses showed slightly poorer performance than the national average with EUI results that were 5% and 7% worse, respectively. The City’s 108 libraries had an average EUI 22% better than the national average while its fire and police stations performed 18% and 8% worse than the national average respectively.

Results by Building Type

The remainder of this report focuses on warehouses, medical offices, K-12 schools, courthouses, office buildings, libraries, fire stations, and police stations. These building types were selected because they include various agencies' facilities and provide a representative sample of municipal buildings. Collectively, these eight building types make up more than 75% of the City's portfolio over 10,000 square feet. See Figure 7 for a summary of the portfolio of buildings benchmarked. For detailed benchmark information on individual buildings see Appendix C.

Figure 7: Number of Buildings Benchmarked by Type

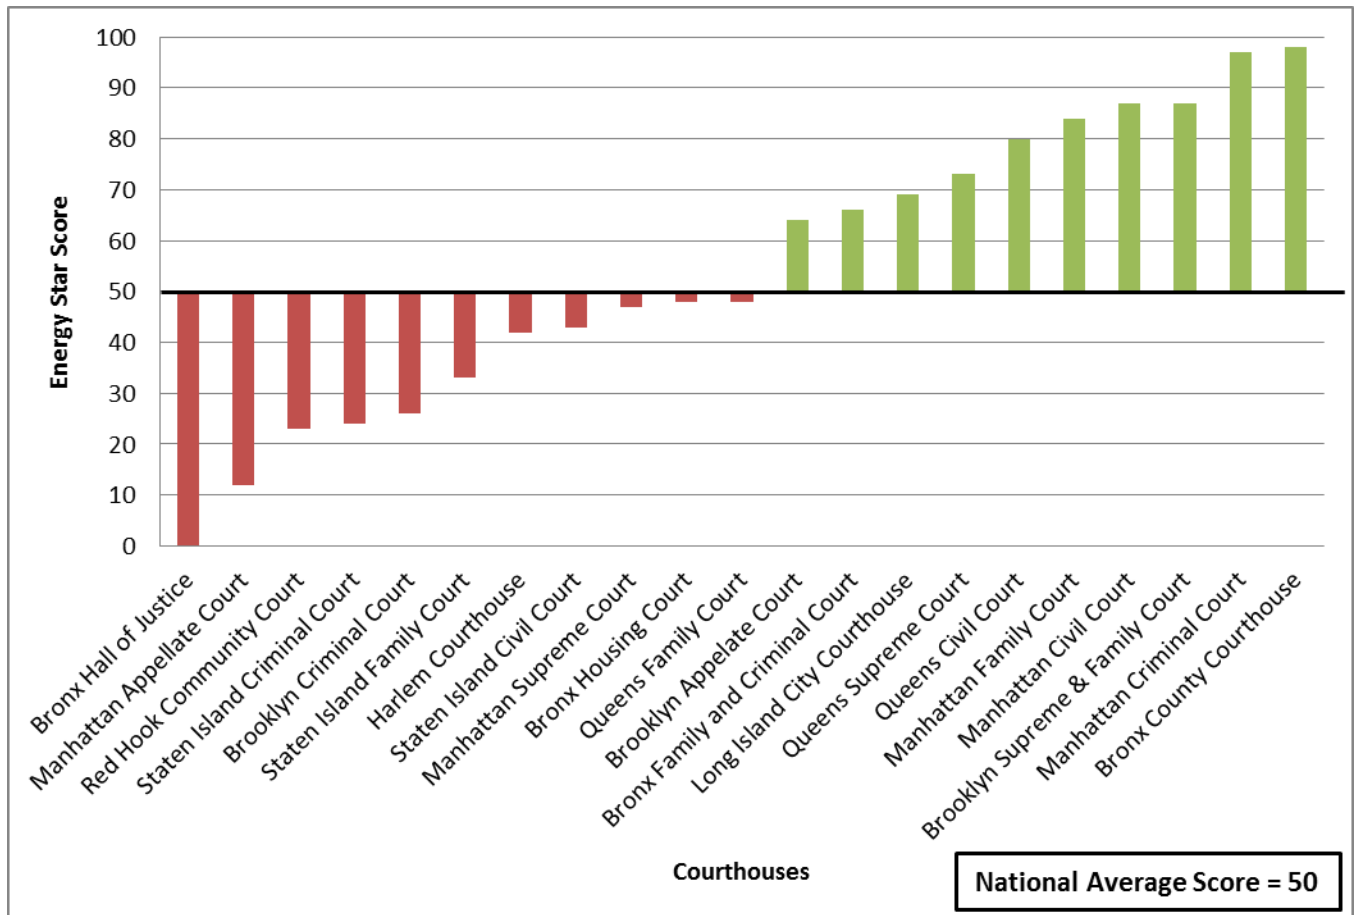

Courthouses

New York City has 21 government courthouses over 10,000 square feet that were eligible for independent benchmarking by August 1, 2011.³ To benchmark the energy use of courthouses, Portfolio Manager uses energy consumption information, gross floor area, weekly operating hours, number of workers on the main shift, number of personal computers, and percent floor area that is air conditioned and heated. See Figure 8 for the results.

³ An additional three courthouses are included in campuses, which are not eligible for benchmark scores: Manhattan Surrogate Court, Queens Criminal Court, and Staten Island Supreme Court.

Figure 8: Courthouse Benchmarking Results, 2010

New York City government courthouses performed slightly better than the average for courthouses nationwide, with an average benchmark score of 55. Forty-eight percent performed better than the national average and 52 percent performed worse.

Courthouse Highlight: Mario Merola Building, Bronx County Courthouse

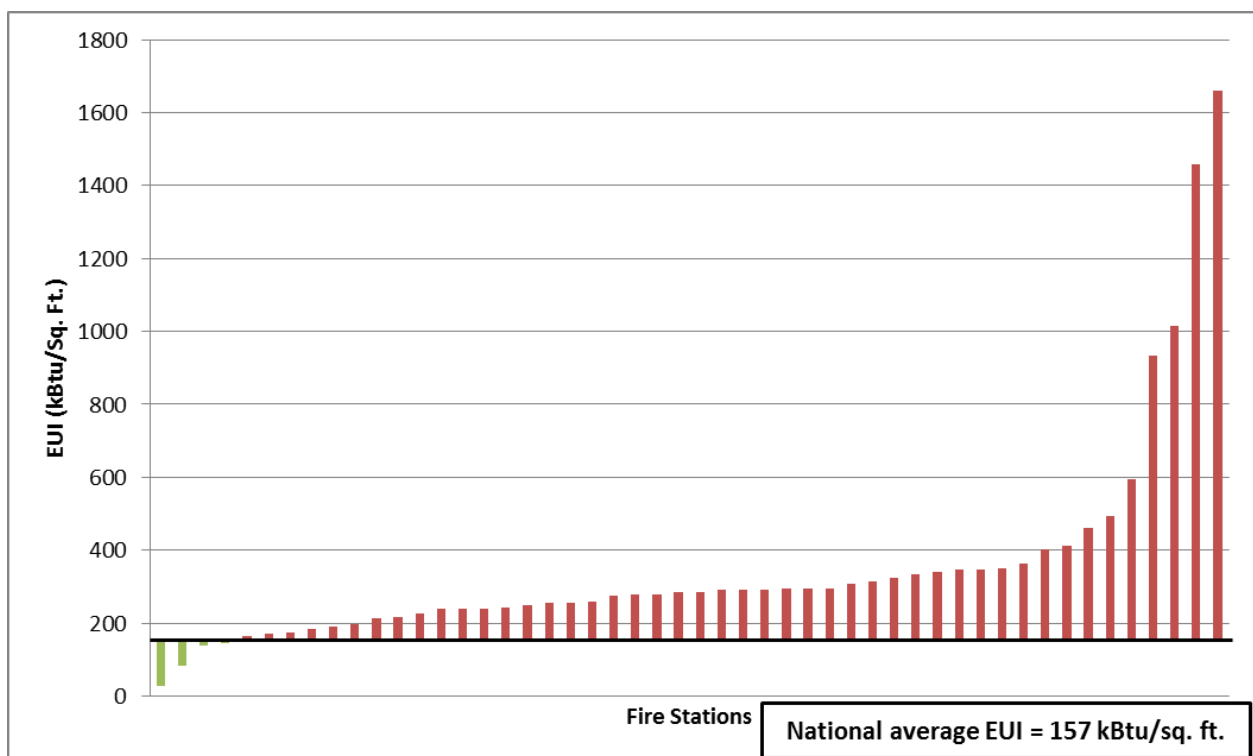

The Bronx County Courthouse, the Mario Merola Building, is a landmark building built in 1933 with 14 floors and 555,600 square feet of space. The building houses the Bronx Supreme Court, Housing Court, and offices of the Bronx Borough President. The courthouse received an excellent benchmark score of 98. This is likely due, in part, to the high efficiency lighting installed by DCAS in the courtrooms and public spaces over the past several years. The courthouse recently received a comprehensive lighting upgrade including occupancy sensors and replacement of inefficient electric motors with new high efficiency motors. DCAS also did a comprehensive energy audit focused on heating, ventilation, and air conditioning (HVAC) upgrades. The measures to be implemented this year include a dual fuel conversion of the boiler plant and a chiller replacement. The lighting and HVAC measures combined will save the City over \$538,000 in yearly energy costs and reduce nearly 2,000 metric tons of annual GHG emissions.

Fire Stations

The City has 50 fire stations over 10,000 square feet that were eligible for benchmarking by August 1, 2011. (Note: The average size of City firehouses is 10,680 square feet and 210 firehouses are under 10,000 square feet.) Portfolio Manager does not currently have a building category specific to fire stations, so these facilities did not receive benchmarking scores. Instead, the City evaluates the energy performance of fire stations based on EUI.

See Figure 9 for weather-normalized source EUI figures for New York City's fire stations. Note that a lower EUI corresponds with better energy efficiency.

Figure 9: Fire Station EUI Results, 2010

The City's fire stations had an average EUI of 226 kBtu/sq. ft. The national average used in the Portfolio Manager tool for fire stations is 157 kBtu/sq. ft. Only eight percent of firehouses performed better than the national average and 92 percent performed worse than the national average. DCAS intends to study these results closely to determine if they might indicate a data quality problem, whether the national average includes firehouses with volunteer fire departments which might bias the results, or if there are actions that the City can take to cure the fire stations' poor energy performance.

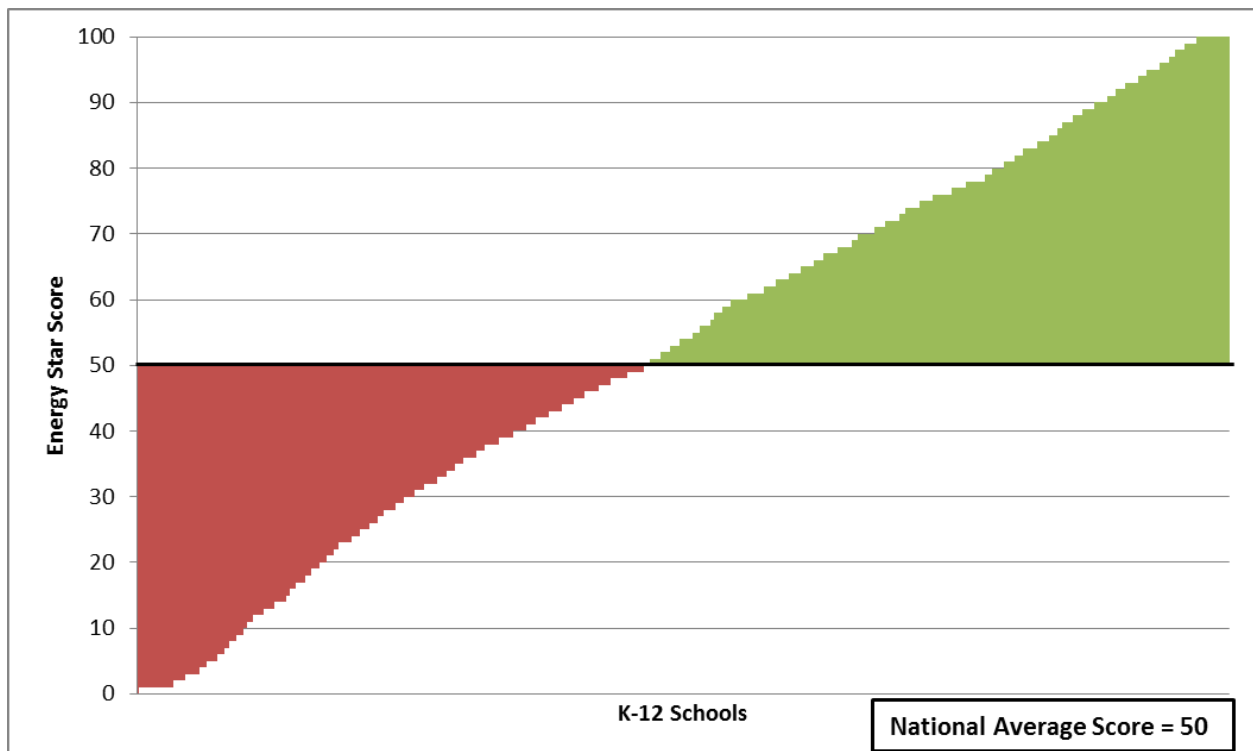

Fire Station Highlight: Small Buildings Program

FDNY has been a proactive partner in working toward the Mayor’s greenhouse gas reduction goals. They will likely be one of the first agencies to play a role in DCAS’s Small Buildings Program. This program is being developed to identify energy conservation opportunities in City buildings between 5,000 and 50,000 square feet such as fire stations, police precincts, and branch libraries. In Fall 2011, DCAS issued an RFP for program planning and development, program administration, and energy efficiency project implementation services in small City buildings. Using the benchmarking data as a guide, the winning contractor will develop a roadmap that prioritizes groups to address the worst performing buildings first, maximizes economies of scale and geographical proximity, and establishes a schedule for addressing each group of buildings. The contractor will then implement the plan starting with a group of pre-determined pilot buildings. The first round of projects will include several Fire Department facilities in Queens.

K-12 Schools

The City has 1,162 K-12 schools over 10,000 square feet that were eligible for benchmarking by August 1, 2011. The New York City Department of Education (DOE) collected and submitted all school benchmarking information. To benchmark the energy use of K-12 schools, Portfolio Manager uses energy consumption information, gross floor area, number of personal computers, number of walk-in refrigeration units, school type, cooking information, weekend operating hours, and percent floor area that is air conditioned and heated. See Figure 10 for the results.

Figure 10: K-12 School Benchmarking Results, 2010

New York City schools performed slightly better than the average for K-12 public schools nationwide, with an average benchmark score of 53. Forty-six percent of schools performed worse than the national average and 54 percent performed at average or better.

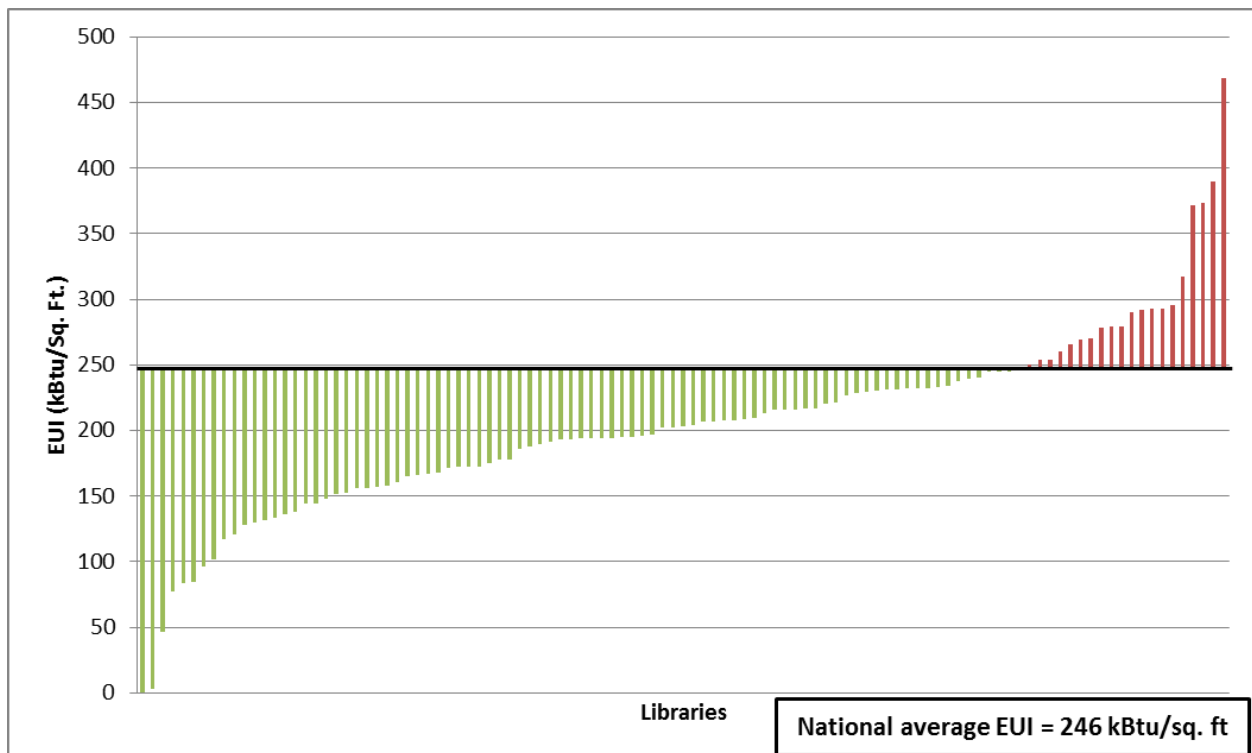

K-12 Public School Highlight: Audit and Retrofit Program

The City's audit and retrofit program identifies and implements energy conservation measures in existing buildings to improve energy efficiency and reduce GHG emissions. Because schools make up approximately 56% of NYC's municipal building stock by floor area and 34% of the City's building GHG emissions, DCAS, DOE, and the School Construction Authority have been focused on improving their energy efficiency. Since 2008, sixty-five energy audits have been completed at K-12 schools and most have moved to design or construction. Over the next year, approximately 120 more comprehensive energy audits will be kicked off in New York City's public schools.

Libraries

The City has 108 libraries over 10,000 square feet that were eligible for benchmarking by August 1, 2011. Portfolio Manager does not currently have a building category specific to libraries, so these facilities did not receive benchmarking scores. Instead, the City evaluates the energy performance of libraries based on EUI. See Figure 11 for weather-normalized source EUI figures for New York City's public libraries. Note that a lower EUI corresponds with better energy efficiency.

Figure 11: Library EUI Results, 2010

The average EUI for the 108 libraries was 192 kBtu/ sq. ft. The national average EUI for libraries is 246 kBtu/sq. ft. Eighty percent of the City's libraries performed better than the national average and 20 percent performed worse.

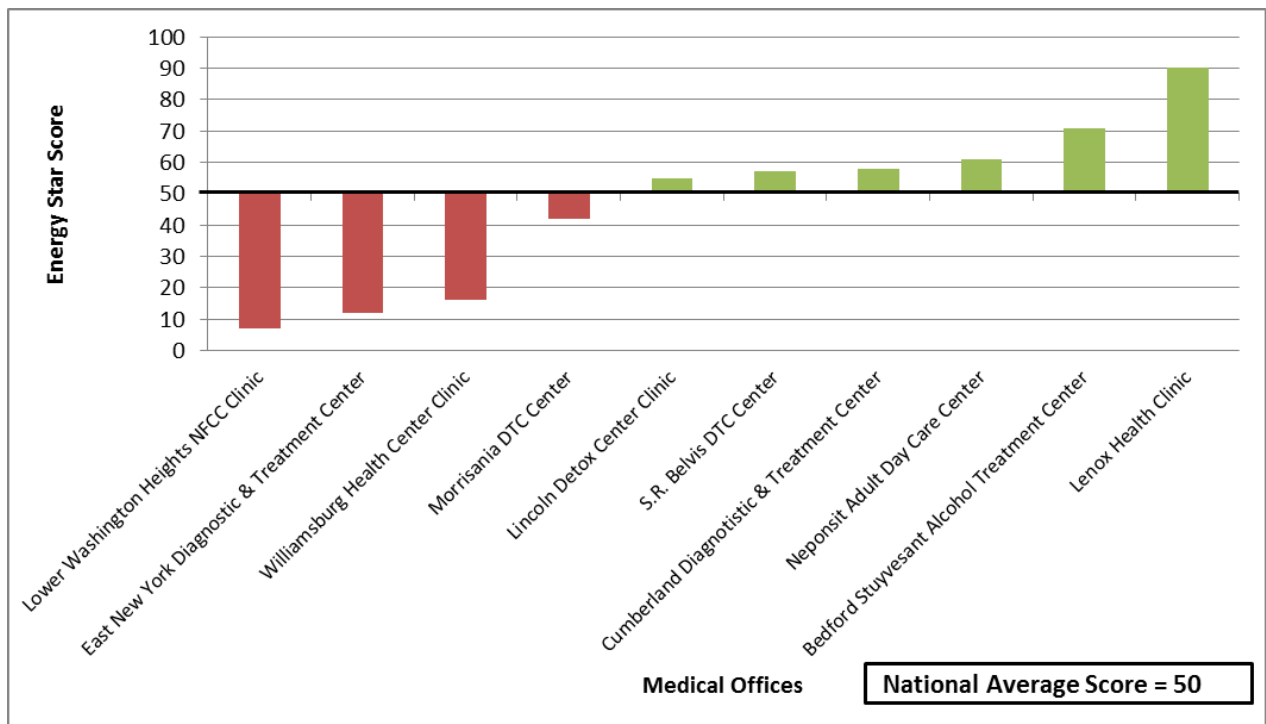

Library Highlight: Brooklyn Heights Branch Library

While the Brooklyn Heights Library's energy use intensity is better than average at 178 kBtu/sq. ft., it is slated for work in 2012 that will improve it even more. The upcoming retrofit will reduce GHG emissions by an estimated 148 metric tons annually, reduce the annual fuel costs by 32% and bring down yearly electricity costs by 39%. The retrofit measures include lighting and occupancy sensor upgrades, a building management system, a boiler replacement and a white roof coating. DCAS will replace T-12 fluorescent lighting with T-8 fluorescents and existing incandescent lamps with LED and compact fluorescents. Occupancy sensors will be installed in select areas. The building management system will include direct digital controllers and variable frequency drives on the air handling equipment as well as the chiller and boiler plants. Existing hot water boilers will be replaced with high efficiency condensing boilers and the white roof coating will improve the overall thermal efficiency of the library.

Medical Offices

The City has 11 medical offices over 10,000 square feet that were eligible for independent benchmarking by August 1, 2011. To benchmark the energy use of medical offices, Portfolio Manager uses energy consumption information, gross floor area, weekly operating hours, and number of workers on the main shift. See Figure 12 for the results.

Figure 12: Medical Office Benchmarking Results, 2010

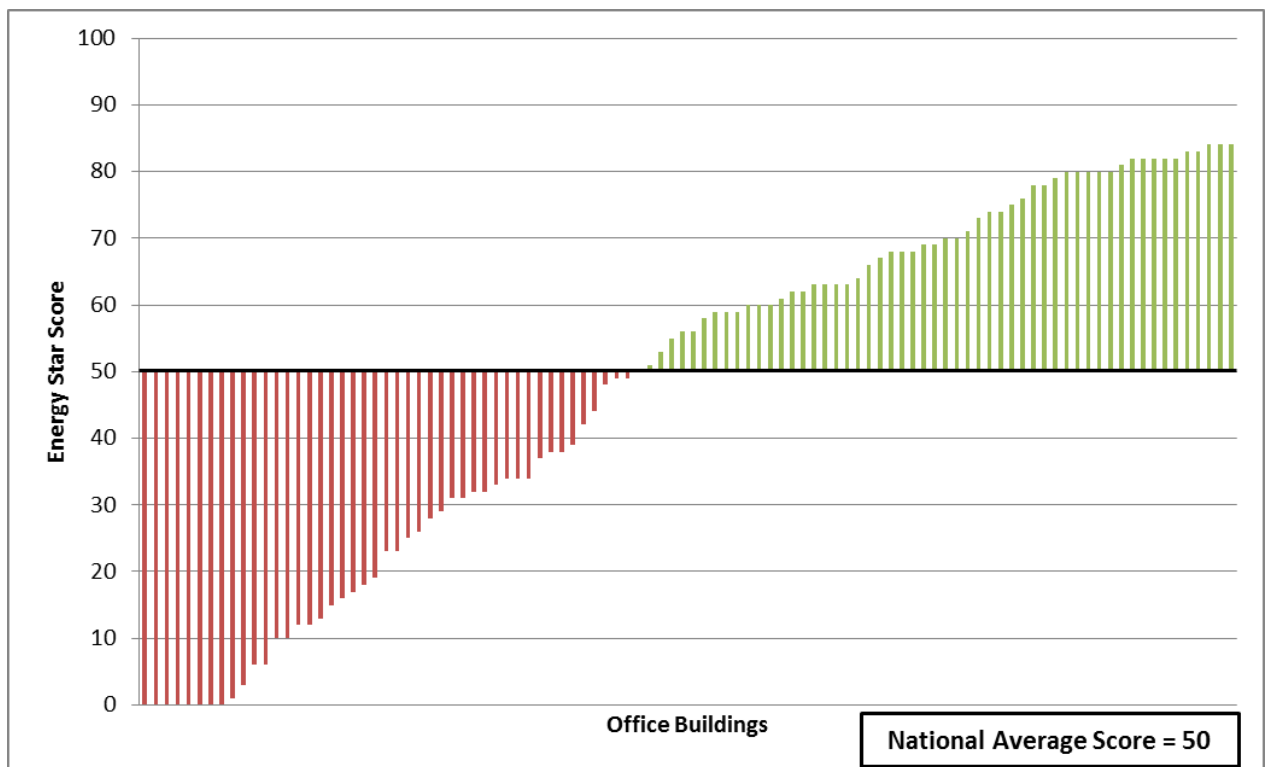

The average score for medical offices was 43. Forty-five percent performed worse than the national average and 55 percent performed better.

Offices

New York City government has 133 office buildings over 10,000 square feet that were eligible for independent benchmarking by August 1, 2011.⁴ To benchmark the energy use of office buildings, EPA Portfolio Manager uses energy consumption information, gross floor area, weekly operating hours, number of workers on the main shift, number of personal computers, and percent of floor area that is air conditioned and heated. See Figure 13 for the results.

Figure 13: Office Benchmarking Results, 2010

The City's office buildings scored 60 on average, slightly higher than the national average for these facilities. 34 percent of the City's office buildings performed worse than the national average and 66 percent performed better. For those office buildings with a score of zero, DCAS intends to study these results closely as this low score indicates a data quality problem.

Office Building Highlight: NYPD Headquarters, One Police Plaza

One Police Plaza is the headquarters of New York's Finest, the New York City Police Department. This 1,000,000 square foot office building was constructed in 1973 and includes administrative offices and other specialized facilities. Intensive use at this office building likely contributed to its poor benchmark

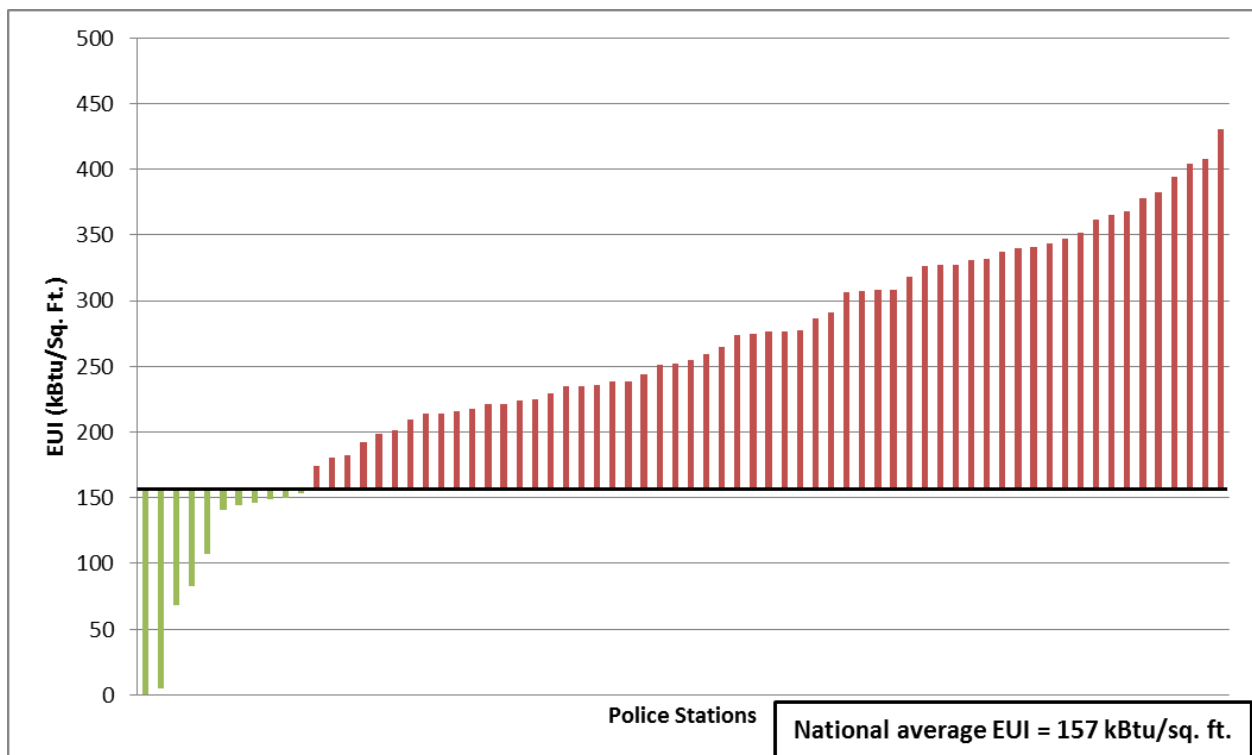

⁴ An additional 14 offices were benchmarked as part of campuses, which are not eligible for benchmark scores.

score of 31. To identify ways to reduce energy, a comprehensive audit was completed last year. The audit recommended several measures that will save the City over \$905,000 in annual energy costs and will reduce its GHG footprint by 3,946 metric tons yearly – a 32% reduction. Construction will begin in December 2011 on high efficiency lighting and controls, a building management system, an air handling unit upgrade, a chiller plant optimization, a data center cooling upgrade, and a new snow melt system.

Police Stations

The City has 78 police stations over 10,000 square feet that were eligible for benchmarking by August 1, 2011. Portfolio Manager does not currently have a building category specific to police stations, so these facilities did not receive benchmarking scores. Instead, the City evaluates the energy performance of police stations based on EUI. See Figure 14 for weather-normalized source EUI for New York City’s police stations. Note that a lower EUI corresponds with better energy efficiency.

Figure 14: Police Station EUI Results, 2010

The average EUI for the City’s police stations was 171 kBtu/sq. ft. The national average Source EUI for police stations is 157 kBtu/ sq. ft. Eighteen percent of the police stations performed better than the national average while 82 percent performed worse. DCAS intends to examine these results to determine if they might indicate a data quality problem or if there are actions that the City can take to remedy the police stations’ poor energy performance.

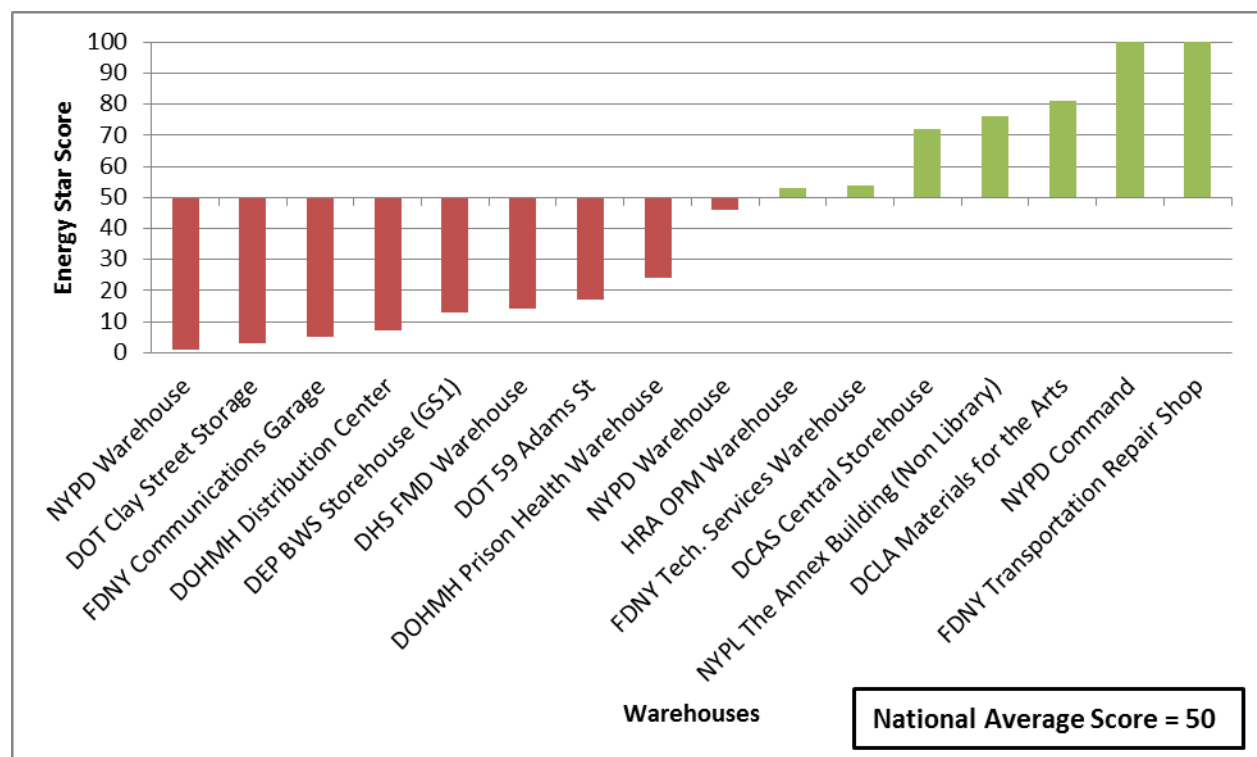

Police and Fire Station Highlight: Operations and Maintenance Program

Operations and maintenance (O&M) practices are the day-to-day activities of a building's engineer or operator that keep a building operating effectively. Energy efficient O&M practices include monitoring energy use, adjusting and properly maintaining equipment, and operating the building's HVAC system and other mechanical systems. O&M efforts have become a high priority in the City and especially within the NYPD and FDNY. Both departments hired energy managers this past year. The Energy Managers ensure that O&M programs and projects are visible to their department's upper management. Utilizing City data sources, the energy managers evaluate and categorize their facilities based on energy consumption. By comparing current usage to benchmark scores and EUI data, the energy managers have identified facility outliers most in need of attention. Plans are now in place to target these sites with low-cost and no-cost O&M solutions to achieve agency reduction goals over the next year.

Non-refrigerated Warehouses

The City has 16 non-refrigerated warehouses over 10,000 square feet that were eligible for benchmarking by August 1, 2011. To benchmark the energy use of non-refrigerated warehouses, EPA Portfolio Manager uses energy consumption information, gross floor area, weekly operating hours, number of workers on the main shift, number of walk-in refrigerators, and percent of floor area that is air conditioned and heated. See Figure 15 for the results.

Figure 15: Non-Refrigerated Warehouse Benchmarking Results, 2010

Fifty-six percent of the City’s non-refrigerated warehouses performed worse than the national average and 44 percent performed better. The average score for non-refrigerated warehouses was 43.

Results by Operating Agency

Comparison of the benchmark results for January to December 2010 for seven of the largest agencies show that a majority of DOE’s and DCAS’s building portfolio is performing better than the national average. Most of the Department of Correction (DOC) and Sanitation (DSNY) facilities are performing worse than the national average. On average, the Fire Department (FDNY), Police Department (NYPD) and Department of Parks and Recreation (DPR) buildings are also performing poorly compared to the national average. See Figure 16.

By square footage, DCAS, DOE, and DPR facilities are performing at or above the national average. See Figure 17.

Figure 16: Performance Compared to National Average (by Buildings and Campuses), 2010

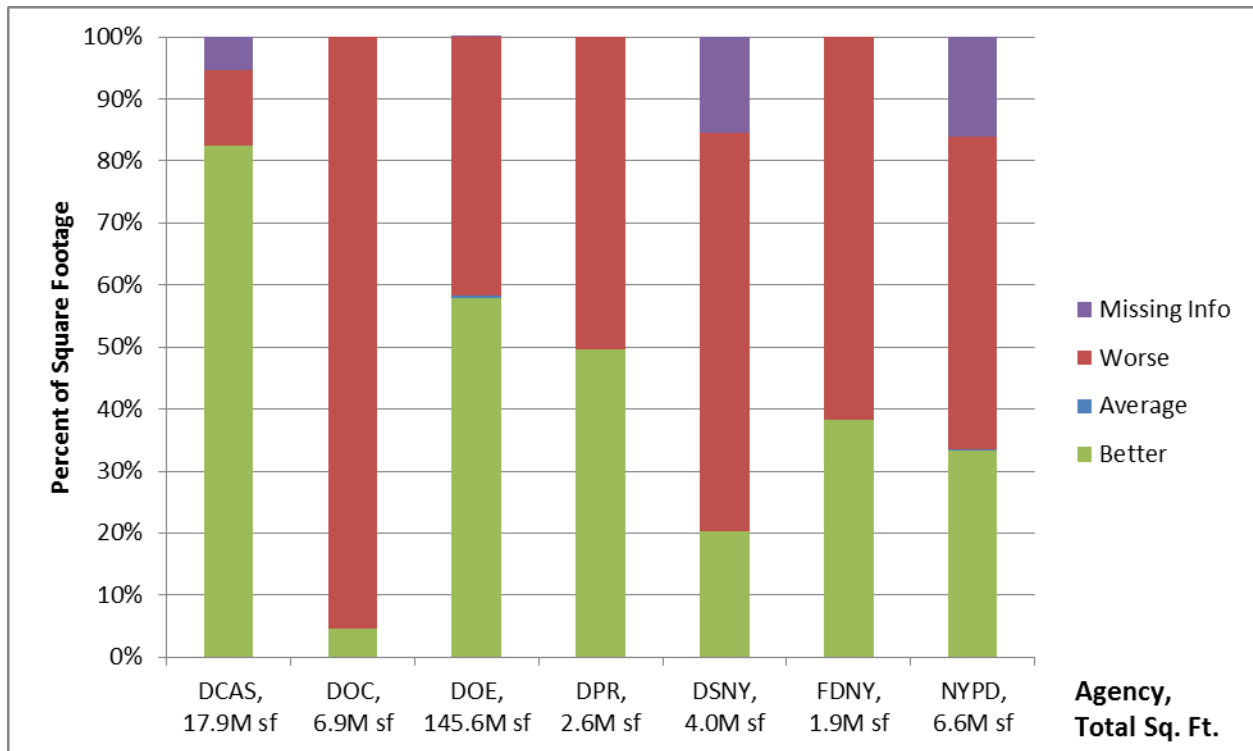

Figure 17: Performance Compared to National Average (by Square Footage), 2010

Conclusion

This report provides the most comprehensive benchmark information possible on New York City government buildings which are 10,000 square feet or larger. Although NYC government buildings of this size are, on average, performing near the national average, there is still much work to be done to achieve the City’s GHG 30 x 2017 target. That is why NYC government’s carbon reduction implementation strategy is based on an integrated, data-driven approach.

This data-driven approach is based on several strategic actions. First, the City is using its benchmark results and other data sources to prioritize energy efficiency projects and monitor building performance over time. Another major piece of DCAS’s strategy, and a component of the Greener, Greater Buildings Plan, is the implementation of energy audits and cost-effective retrofit measures. Next, these retrofit efforts are tied to improved O&M and retro-commissioning. Finally, the City analyzes the energy performance results regularly. Future year-to-year analyses against benchmark baseline scores will allow the City to identify the impact that factors such as efficiency investments, building management and occupant behavior have on energy use. DCAS will conduct further analyses and will proceed with data quality improvements, including sub-metering and the SEPTS tracking system, over the course of the next several years.

B. Table of Agency Total Square Footage and Total Number of Buildings or Campuses Benchmarked

Agency	Total Sq. Ft.	Total Buildings or Campuses
Administration of Children Services	5,567,171	137
Brooklyn Public Library	855,065	30
Chief Medical Examiner	371,900	3
City University of New York	25,507,923	21
Department of Sanitation	4,006,683	69
Department for the Aging	326,403	13
Department of Citywide Administrative Services	17,854,535	54
Department of Correction	6,905,392	6
Department of Cultural Affairs	8,192,028	35
Department of Design and Construction	232,338	2
Department of Education	145,637,917	1,162
Department of Environmental Protection	1,358,150	20
Department of Health and Mental Hygiene	1,231,198	28
Department of Homeless Services	2,961,149	45
Department of Parks and Recreation	2,567,535	77
Department of Transportation	1,350,490	26
Emergency Medical Services	18,500	2
Fire Department	1,869,173	57
Health and Hospitals Corporation	16,873,725	28
Housing Preservation and Development	284,715	7
Human Resources Administration	4,347,498	47
New York Public Library	2,985,011	60
NYC Economic Development Corporation	1,663,433	8
Office of Emergency Management	68,091	1
Police Department	6,627,605	111
Queens Public Library	499,300	19
School Construction Authority	258,952	1
Taxi and Limousine Commission	203,013	1
Grand Total	260,624,893	2,070*

*An additional 707 buildings were included in the benchmark results of 47 campuses. These buildings did not receive individual benchmark scores in Portfolio Manager. The total number of buildings including those benchmarked as part of campuses was 2,730.

C. Benchmarked Facilities Table

† This calculation uses U.S. Environmental Protection Agency (EPA) eGrid greenhouse gas emissions factors.

* Ratings of "N/A" indicate U.S. EPA space type categories for which the Portfolio Manager tool does not provide a score at this time.

‡ Data used to generate this report were collected and reported by several City agencies. The information in this report is subject to change due to data quality improvements, energy efficiency and conservation efforts, and changes in building use over time.
