At-Risk Populations

Those residing in close proximity to Warren's extensive coastline in the Special Flood Hazard Area (SFHA) comprised of the V and A Flood Zones are more at risk to coastal flooding.

Social vulnerability (e.g., from low income) can further compound coastal risks. As depicted in **Figure 4-17**, of the roughly 970 people who reside on land below an elevation of 5-feet, the vast majority fall into the high social vulnerability category.

Figure 4-17 Vulnerable Population Residing on Land below 5-Foot Elevation

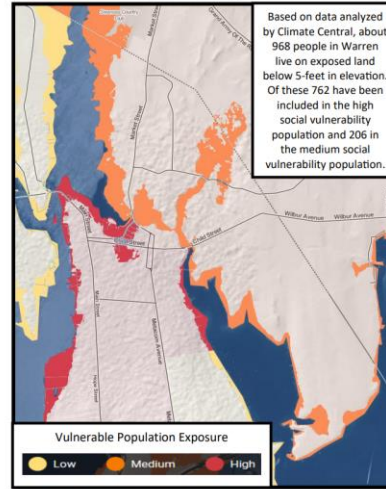

Image Credit: adapted from Climate Central. Surging Seas Risk Zone Map

Image Credit: Climate Central. Surging Seas Risk Zone Map

"According to the National Climate Assessment, coastal flooding in the northeast has increased due to a rise in sea level of around one foot since 1900. And in the future, if we continue to emit greenhouse gases, global sea levels are expected to rise one to four feet by 2100. Specifically in the coastal Northeast, due to the natural sinking of land, sea levels are likely to rise even **higher** than the global average. A sea level rise of two feet would more than triple the frequency of coastal flooding across the Northeast, without any change in storms" (Di Liberto).

Government Use Case Examples

Organization	Climate Central Resource	Intended Use of Download (as entered by end user)
County officials in Dept. of Planning & Zoning	Map	planning
State Lands Commission	Map	granted lands vulnerability assessment
Federal agency	Risk Finder	environmental planning & risk analysis
County/State Office of planning	Scenario 2100 data	research and long-range planning
County Utilities Authority	Map	resiliency planning
Federal agency	Map	NEPA environmental assessments
County Board of County Commissioners	Guide on using Climate Central tools within NFIP CRS	CRS planning
State Department of Conservation and Recreation	Map	relocation of facilities
City in Maryland	Risk Finder	data collection for comprehensive plan update
City in New Hampshire - Planning Department	Scenario 2100	planning & zoning
City in California	Risk Finder Fact Sheet	FEMA Grant
State Department of Transportation	Risk Finder Forecast Data	Grant application

What sea level rise will look like in cities that have hosted climate summits

By Rachel Ramirez, CNN
© 3 minute read · Updated 10:44 PM EST, Sun December 3, 2023

Facebook X Email

(CNN) — As global leaders and delegates gather in Dubai for the [annual UN climate summit](#), a new analysis shows how the host cities of previous summits could be inundated — if not entirely submerged — by rising ocean waters.

The relentless rise of planet warming pollution has already resulted in severe droughts, deadly floods and rapid melting of glaciers and ice around the world. And scientists say the steady climb of global sea level will continue for many decades as temperatures crank higher.

The analysis from [Climate Central](#), a nonprofit climate research group, illustrates the risk if countries fail to halt the planet's precipitous warming trend. A recent UN report showed the world is currently on track to warm up to [2.9 degrees](#).

Using peer-reviewed sea level rise projections and local elevation from Climate Central's models, the findings show compelling visuals that paint a stark contrast between the world as we know it and our high-tide future, if the planet warms to 3 degrees Celsius above pre-industrial levels.

What sea level rise could look like at the Fortaleza del Real Felipe in Lima, Peru.

floodgen

Flood advocacy tool using AI generated imagery

Project overview

- 01** Intro to floodgen
- 02** Prototype
- 03** Generative AI behind floodgen

1.3 million

New York City residents live within or directly adjacent to the floodplain. Flood damage is extensive, expensive, and oftentimes predictable.

floodgen

An aerial photograph of a city, likely New York City, showing a dense urban grid. A large, irregular area is highlighted in a semi-transparent blue color, representing predicted flooding. This area follows the coastline and extends inland through various streets and blocks. The blue overlay is most prominent along the waterfront and in several large, irregular shapes that suggest significant inundation of low-lying areas. The rest of the city is shown in its natural aerial perspective, with buildings, streets, and green spaces visible.

Maps of predicted flooding are helpful planning tools, but aerial views distance viewers from its potential impact.

Source: FEMA, PFIRMs, 2015

floodgen

fg

If we show the reality of predicted flooding through photorealistic imagery, could people be more prepared?

floodgen

Street view

AI generated

floodgen Prototype

Objectives

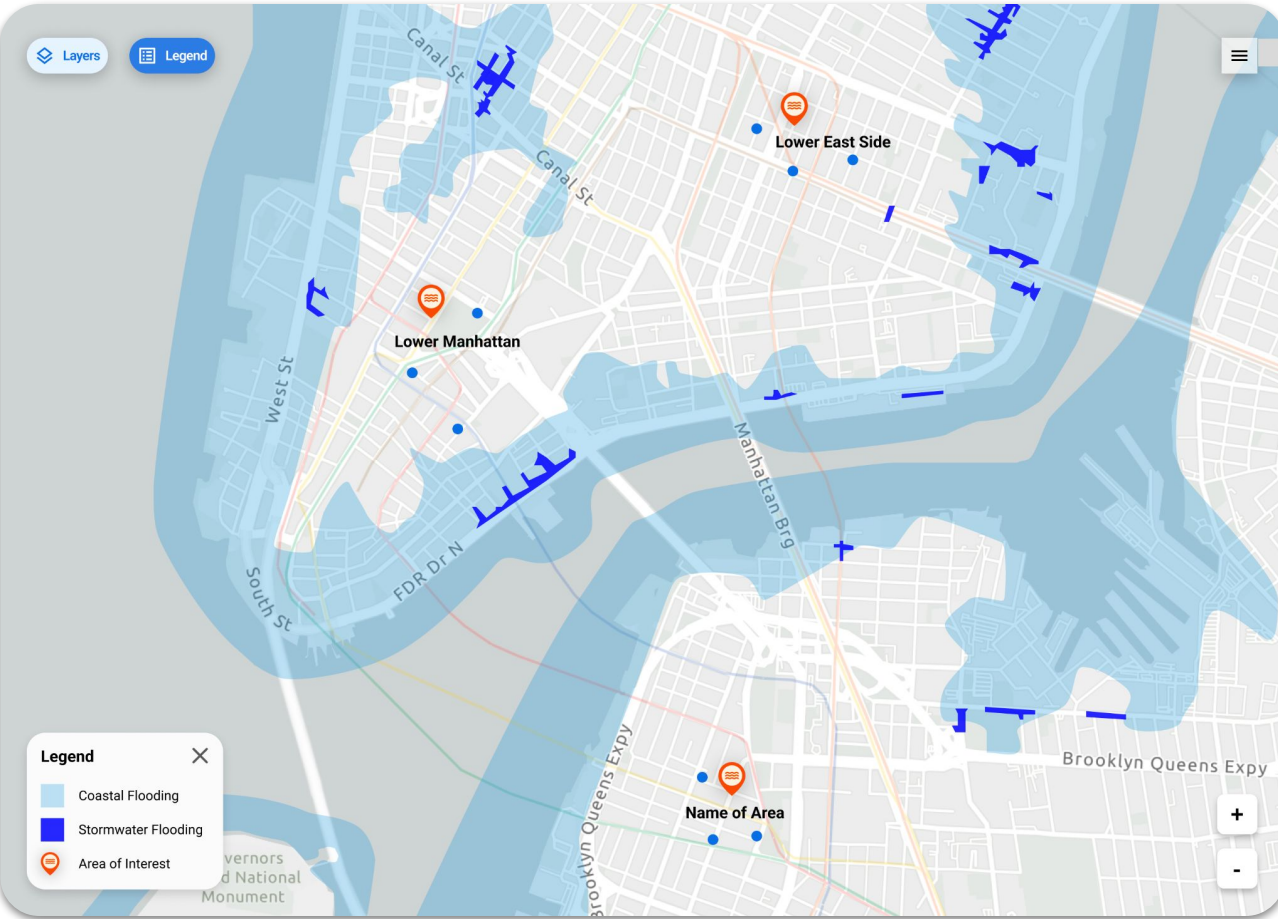

Contextualized map

- Select a point location for street views and generate a flood image
- Reference predicted flood risk hazard, vulnerability, and exposure
- Explore case study locations based on flood risk and advocacy framing

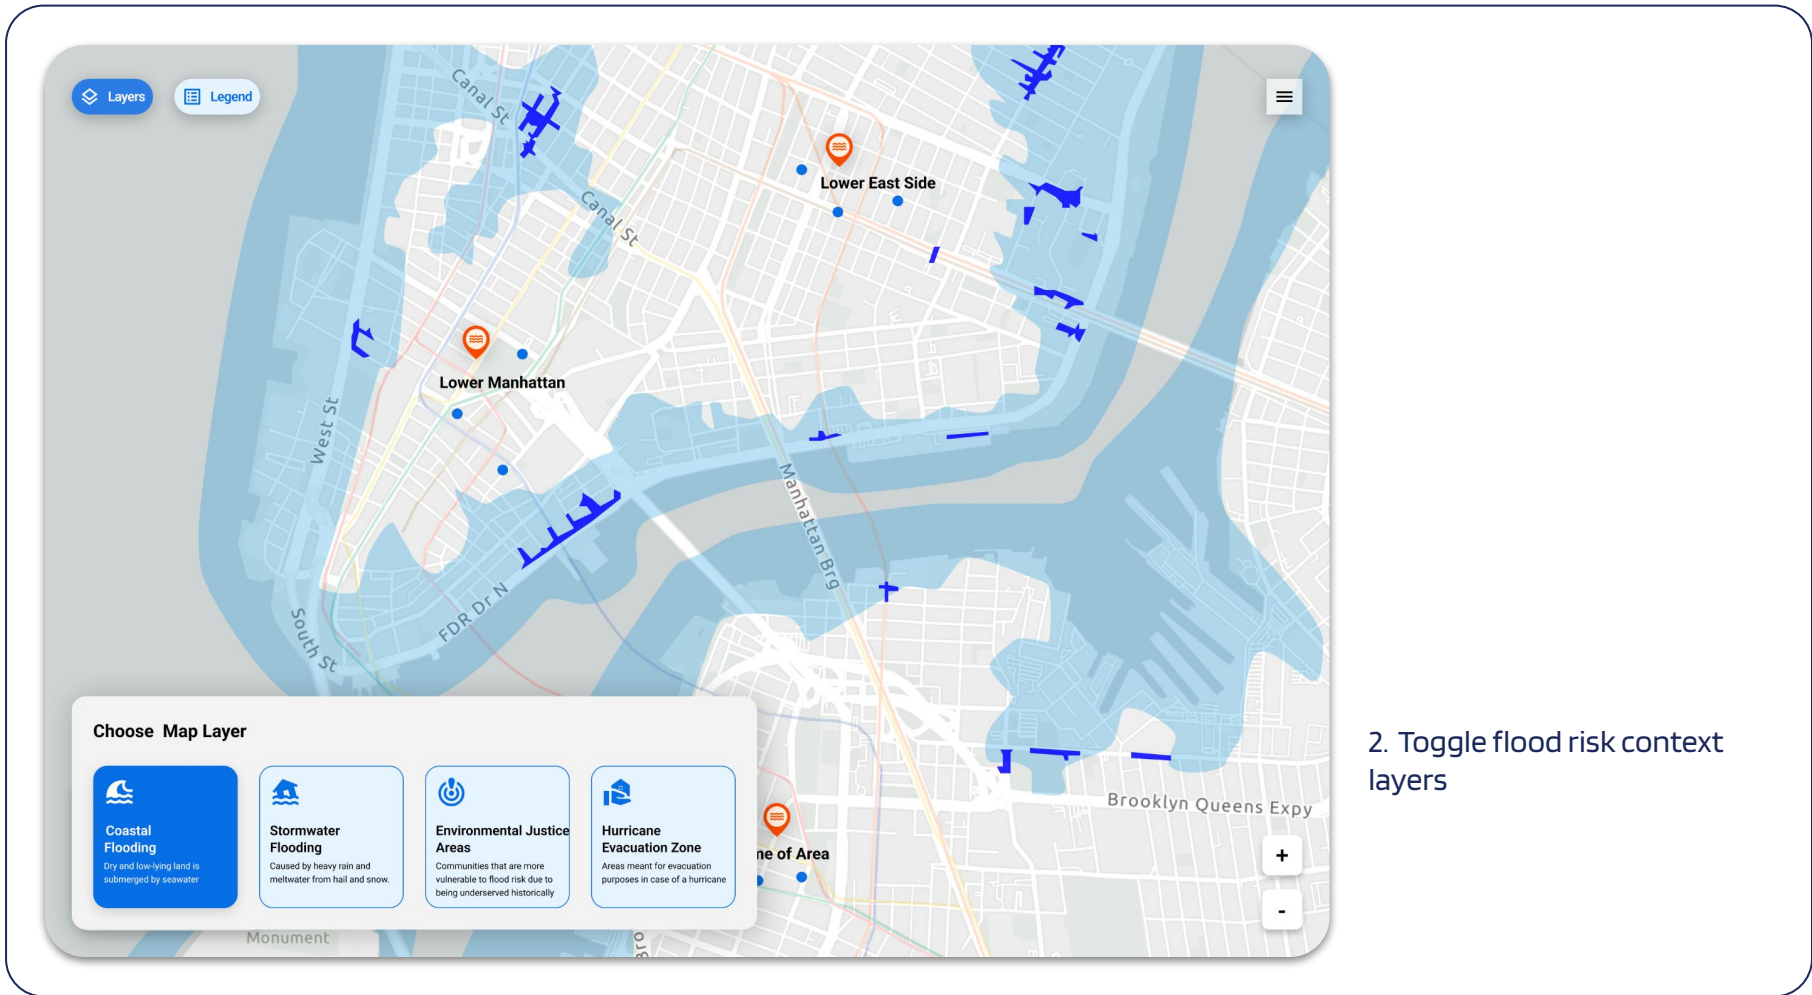

Flood imagery

- Use generative AI to visualize photorealistic images of predicted flooding conditions
- Frame advocacy and clearly identify the images as AI generated to mitigate misuse of the imagery and misinformation

1. Explore locations through the map:
- Predicted flooding risk
 - Case study sites

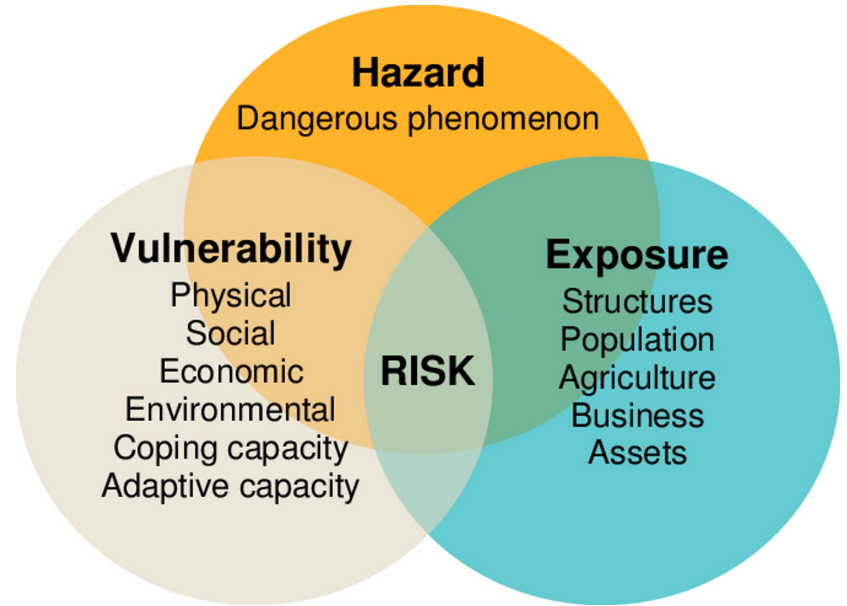

2. Toggle flood risk context layers

Flood risk framework

Analysis framework

- Vulnerability
- Hazard
- Exposure

Flood risk map layers

○ Coastal Flooding

[hazard] Federal Emergency Management Agency (FEMA), Preliminary Flood Insurance Rate Maps (PFIRMs). Shows areas vulnerable to flooding from 1% annual chance storm (100-year floodplain), and 0.2% annual chance floodplain (500-year floodplain).

○ Stormwater Flooding

[hazard] Department of Environmental Protection, Moderate Flood with 2050 Sea Level Rise. Areas are categorized into (3) flooding categories: nuisance flooding, deep and contiguous flooding, and future high tides.

○ Environmental Justice Areas

[vulnerability] Mayor's Office of Climate and Environmental Justice (MOCEJ). Environmental justice areas are defined as low-income community or a minority community located in a census tract.

○ Hurricane Evacuation Zones

[vulnerability] New York City Emergency Management (NYCEM). Areas represent varying threat levels of coastal flooding resulting from storm surge.

Hurricane Evacuation Zones

1. Explore locations through the map:
- Predicted flooding risk
 - Case study sites

Community engagement strategy

01

Awareness for new communities

Communities that have not yet had real experiences with flooding, but may be prone to flooding

Goal: create more awareness of flooding potential

02

Evidence for resilience services

Communities that have experienced repeated flooding, but have not yet received services for resilient projects

Goal: generate more evidence to continue advocacy

03

Response to advocacy

Municipal government agents, decision makers, and people responding to advocacy efforts

Goal: align priorities, share intention to support advocacy efforts and decision making

Beach 84 St: flood detections + depths

About this Report

The maps and charts in this report show the severity, frequency, and location of street-level flood events from 2020 to 2023. This report was generated using data from FloodNet sensors, 311 reports, and photos of floods submitted to the Community Flood Watch Project. It will be updated again in March 2024.

Who made this report?

This report was made collaboratively by New York Sea Grant and FloodNet NYC.

Learn more about flooding and flood risk in NYC

Since Dec. 2021 when the first neighborhood flood sensor was installed **117 floods** have been recorded, and the highest water level detected was **38 inches** at Beach 84 St on 12/23/2022.

History of neighborhood flood detections + 311 flood complaints

Exploratory data visualization of Flood Watch data

Community meetings with Howard Beach Flood Watch group 2021

To keep my community aware of upcoming conditions but more importantly current conditions in regards to tidal flooding.

Both, the data to help make a persuasive case to electeds and the media as well as notifying us when to be on alert

To monitor the rise of sea/water level (important!)

Real time flood information. Sometimes I use this info to protect my personal property. (House and Car) Sometimes I use it to determine ability to travel around town.

As discussed integrated reporting would be helpful

I would love to be able to see how flooding impacts Coney Island in every way. From the geographic communities most impacted to the times of the year when flooding happens to how flooding impacts new development in Coney Island. I want elected officials to be able to check into the tool and see where the highest needs in the community are so that the official can go to an agency head and say here is the block that needs flood mitigation firsts here

You said informing the community but how? Most older folks are not social media knowledgeable so a siren would be great

We must educate the community of the availability of the data and the value of using them.

To get an understanding of the different times of the day/year when flooding is more or less frequent

I would love to be able to see how flooding impacts Coney Island in every way. From the geographic communities most impacted to the times of the year when flooding happens to how flooding impacts new development in Coney Island. I want elected officials to be able to check into the tool and see where the highest needs in the community are so that the official can go to an agency head and say here is the block that needs flood mitigation first

You said informing the community but how? Most older folks are not social media knowledgeable so a siren would be great

Could there be more information and educational material to inform the public about what circumstances are contributing to more severen flooding (USGS data,

looking at aggregate data over time allows people to see where water levels are truly rising and how much

We need raw data but also data that has been processed, digested and easy to communicate

Searchable, editable, queryable, exportable

Sealevel rise is very important, 100% agree with that

SLR important to everyone: homeowners, business owners, renters, car owners, etc. Pictures are so valuable, but more information (context, dates, details, why was there flooding, etc) is even better. How can this cumulative reporting on Flood Watch be put into one large package to leverage this

What if we could use the photos and overlay a future visualization to show how this already bad situation is going to get worse? and do this in a

Need for collaboration between entities: city, federal, state, community. In end it comes to the people, residents and

City Council: participatory budgeting is where there is funding. City Council is an important audience

Introduction / Big Picture

Topics

- How can we use Floodwatch data to better inform decision making and communication to our stakeholders?
- How can we use Floodwatch data to better inform decision making and communication to our stakeholders?
- How can we use Floodwatch data to better inform decision making and communication to our stakeholders?

What do we want to create a tool for or a portal that would?

Guiding Questions

1. Resident use cases for flood data (quantitative)
 - a. What would motivate you to seek out this data?
 - b. Would you share this data?
 - c. How would you share it?
2. Resident use cases for photographs of flooding (qualitative)
 - a. What would motivate you to seek out this data?
 - b. Would you share this data?
 - c. How would you share it?
3. How to integrate these two data sources (quantitative and qualitative)?
- 4. Resident use-cases for summary reports of neighborhood flooding that integrate these two data sources?**
5. Resident use cases for an interactive web tool that integrates these two data sources?
6. How do residents access neighborhood-level information right now, and how do they share it?

Neighborhood Flood Report Use-Cases

1. Sharing information about neighborhood flood impacts with residents and CBOs
 - a. via community hubs
2. Education about *why, where, and when* floods occur
3. Sharing summary information about flooding with elected officials, journalists
4. Education about flood preparedness
5. Useful for community organizing - staying in touch with local people and issues, up to date on elected officials info, etc.

Flood Events by Day in CDTA o6: Red Hook, Carroll Gardens, Gowanus

We made a lot of maps and flood charts

but rejected many approaches, sometimes because the data was misleading (showing false flood detections), or in this case because users found a less abstract representation of flooding easier to understand.

Beach 84th St Sensor, Daily Flood Events, 1/2022 - 7/2023

We kept the year over year representation; (looking towards the future when the sensor network has a longer history) to make it easier to see any seasonal patterns in flood activity.

There is a wide variation in the amount of data from neighborhood to neighborhood

Weekly Highest Flood Detection, Hoyt and 5th Streets Sensor

Annotated local report in progress tracking variables to accommodate across reports for diverse geographies and flood circumstances

Flood report update in progress
Notes + Data Queries

Sensor names might require 2 lines for chart titles.

- Maintain this block of space for this and other chart-specific variations
- Create + use new label field for sensor names

Neighborhood shapes vary -- we've created custom neighborhood boundary file for best display in automated reports. (a combination of NTAs and CDTAs)
This map is square to accommodate horizontal and vertical neighborhoods

If no photos from report area available, a more general title will be used (NYC rather than neighborhood name)

Photos are square to accommodate varied photo formats. Photos to be cropped to the center square area.

Criteria for photo selection:

- match **neighborhood**
- match **flood depth** (single event chart)
- match **date** of single flood event

If none of above, look for recent photos from nearby

Variable length text, maintain space for this content

Red Hook, Gowanus, Park Slope + Carroll Gardens

Neighborhood Flood Data

Flood Sensor Locations

- Floods detected
- Sensor nearby or flood observations

Community Flood Observations

- Flood observations - description

311 Flood-related complaints

- Complaint descriptions tracking

Flood Sensor Detection Frequency Citywide

What does similar flooding look like in New York City?

Submit a photo to Flood Watch:

Comments:

9/1/2021, time 1 - Estimated Depth: 30 inches - Ins after high tide: 1 - Location: 1

9/1/2021, time 1 - Estimated Depth: 30 inches - Ins after high tide: 1 - Location: 1

9/1/2021, time 1 - Estimated Depth: 30 inches - Ins after high tide: 1 - Location: 1

9/1/2021, time 1 - Estimated Depth: 30 inches - Ins after high tide: 1 - Location: 1

both charts will vary in length, depending on:

- time sensors have been deployed
- start time of chart
- can be 3 or 4 rows for 3 years of data
 - is there a way to keep consistently at 3 rows?

Criteria for sensor selection:

- longest history in neighborhood
- most severe flooding

Maintain this full block of space

Single event selection:

- use event with deepest flood detection
- and / or event selected by Floodnet team, indicated and updated in spread sheet every 6 months

Local flood report, August 2023

Hoyt St & 5th St: measured floods + depths

History of flood detections + 311 flood complaints

Sensor names: two fields in the data, neither great for reports:

- "BK - Carroll St/4th Av" (no need for "BK -")
- "Carroll & 4th" (should include St or Av)

Add a label field to data with short, intersection-based names:

- "Carroll St & 4th Av" and "Dwight St & King St"

To reduce clutter, text about sensors not covering basement flooding moved here

Local flood report, August 2023

Beach 84th St: measured floods + depths

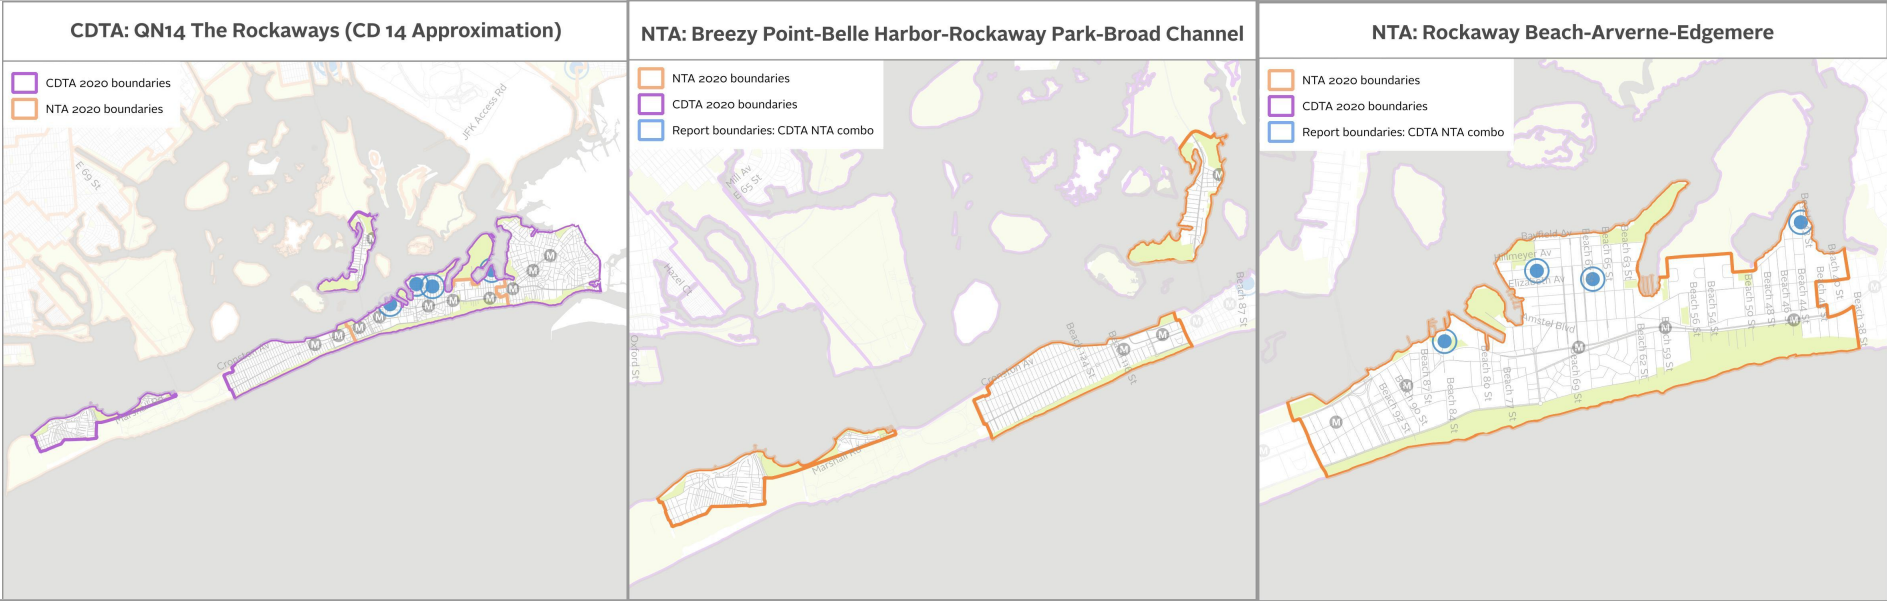

Statistical overview of the neighborhood: has it been cut? it was not in the comment-draft but I can't find notes about it.

This is not updated with data -- counts might be wrong, the legend will explain how many flood detections per month for each color

Number of sensors per neighborhood varies

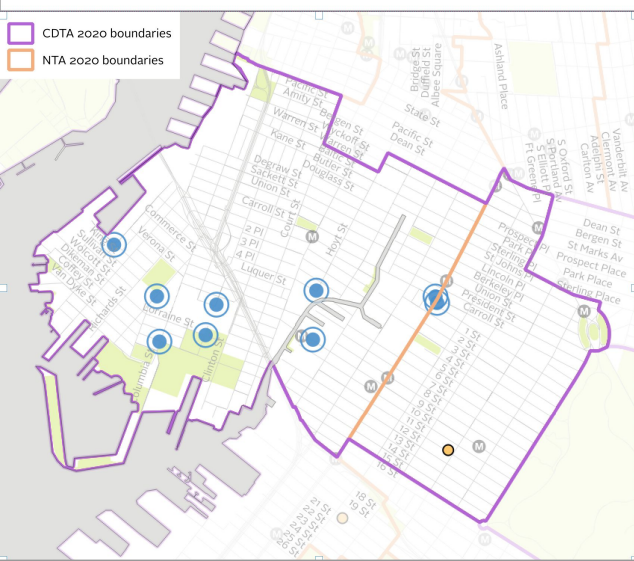

- limit to certain #
- selection criteria if too many:
 - most active?
 - or longest deployed?

Geographic variations

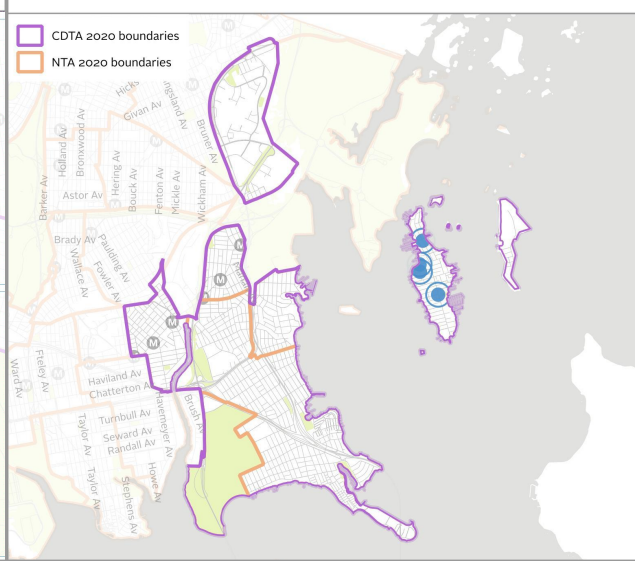

Nearby size + data variation impact legibility of neighborhood maps

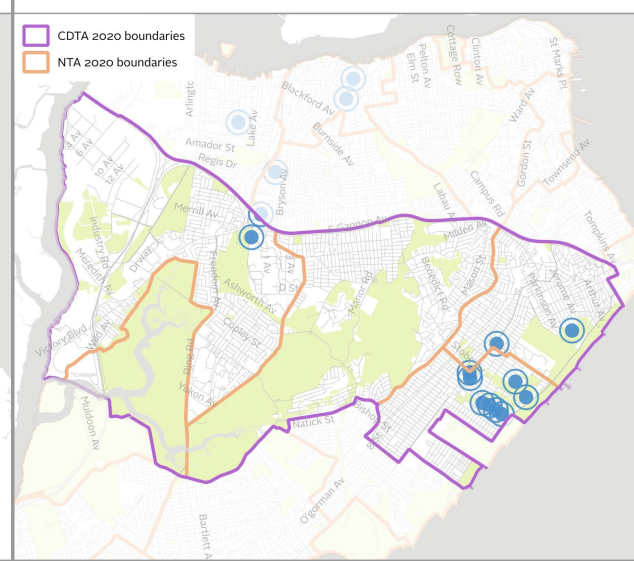

CDTA: BKO6 Park Slope-Carroll Gardens (CD 6 Approximation)

CDTA: BX10 Co-op City-Throgs Neck (CD 10 Approximation)

CDTA: SIO2 Mid-Island (CD 2 Approximation)

About this Report

The maps and charts in this report show the severity, frequency, and location of street-level flood events from 2020 to 2023. This report was generated using data from FloodNet sensors, 311 reports, and photos of floods submitted to the Community Flood Watch Project. It will be updated again in March 2024.

Who made this report?

This report was made collaboratively by New York Sea Grant and FloodNet NYC.

Learn more about flooding and flood risk in NYC

Since Dec. 2021 when the first neighborhood flood sensor was installed 117 floods have been recorded, and the highest water level detected was 38 inches at Beach 84 St on 12/23/2022.

Website Development informed by the focus group

User journey 1

 <p>User: A resident of a flood prone area is frustrated with the problems associated with regular flooding in their neighborhood, they feel it isn't covered in the news and that elected officials are ignoring the problem. They want to find solutions and take action.</p> <p>Expectations: - to find historical data about flooding in the area that demonstrates the problem - accessible information to support arguments for addressing local flood problems</p>			
<p>1</p> <p>Discovers FloodNet / Flood Watch (HOW?)</p> <ul style="list-style-type: none"> - finds the web site - site invites user in to explore data - user enters + explores site <p>Where can I find information about flooding in my neighborhood?</p>	<p>2</p> <ul style="list-style-type: none"> - Finds neighborhood - explores sensor and flood post data viz and can see patterns of tidal flooding in past + higher rates of flooding in some seasons - explores flood post photos - sees other components of site <p>How do I tell the story to someone who can help?</p>	<p>3</p> <ul style="list-style-type: none"> - finds local reports - downloads pdf - shares with community members - shares with council member listed on site within neighborhood map view - shares with media outlet listed on site - community members go to web site - discussion continues in community and local knowledge re. living with flooding or preparing is shared <p>I've got a tool to communicate with, how can I get it to people who can help?</p>	<p>4</p> <ul style="list-style-type: none"> signs up to follow neighborhood social media account - sees posts of high tide warnings - sees flood post of community member - sees post about recent flood detected by a local sensor - user joins the social media account - begins to discuss and share tips about things like where to park a car when high tide flooding is predicted <p>I can share stories, local knowledge and learn from others here, as well as see quantifiable flood data about my area.</p> <p>I'll join my neighborhood account and become an active member of this community.</p>
<p>Opportunities</p> <p>Show all sensor and flood postings in one space / map</p> <ul style="list-style-type: none"> - allow people to focus on fine grained data on a neighborhood level - organize content according to neighborhoods for everything, gearing it towards hyper local reports + council districts, also provides a way to organize social media accounts that are hyper local, and a way to segment data to help it load fast and be lightweight - social media and local reports + flood posts all have potential to drive user and community engagement 		<p>Tool requirements:</p> <ul style="list-style-type: none"> - new design, integrated and consolidated data views - social media account maintenance - discussion moderation? - local report updates - neighborhood-specific media or gov. outlets for disseminating local reports 	<p>Questions:</p> <ul style="list-style-type: none"> - can similar level of engagement be achieved through flood postings alone? - what options are there for discussion and engagement?
